

Pre-built Blocks, and Formula Builder.

Back testing and simulation engine:

This is the rigorous “proving ground” that separates a good idea from a robust strategy for execution. It must be scientifically sound, computationally efficient and aligned with real-world execution constraints. Some of the key capabilities that firms need to invest in include Point-in-Time Data, Cost Modelling, Factor Exposure / Rebalancing logic and Performance Analytics.

Data governance & operational capabilities:

Robust data governance will enable the enterprise to derive value from data investments. We suggest a **data product approach** with data

ownership from the business and operations team, which would enable the enterprise to drive higher ROI. And a well-defined Machine Learning Operations (MLOps) environment. This ensures the platform is secure, scalable, and compliant. Key capabilities would be - Version Control, Access Management, Model Deployment, model monitoring, and predictive and corrective actions for model drift, supported by a robust governance framework.

“New ways of working”: As artificial intelligence and digital agents become mainstream, mutual fund houses must invest in enabling the workforce for “new ways of working”. A structured organization change management

exercise is essential for adoption of newer technologies, embracing the change through structured organizational transformation and workforce enablement.

For asset managers, developing this capability is not merely a tech upgrade—it’s a strategic imperative. A well-implemented no-code platform that harnesses unstructured data doesn’t just streamline workflows; it industrializes pursuit of alpha generation. By transforming investment decisions from isolated, artisanal efforts into a scalable, repeatable “alpha factory,” firms gain a decisive edge—enabling faster insights, broader coverage, and more consistent performance than competition!

Transform customer experience for the digital age.

The future of financial advice is scale and speed.

It’s also personalized—with AI and analytics.
