EYE ON AI

• Indian information technology companies are taking the first few steps to keep growing in an increasingly AI-driven world

Infosys®

wipro®

HCLTech

STEPS TAKEN

• The company will invest \$6-7 billion to build a one-gigawatt data centre over the next five to seven years

• The capital expenditure requirement will be funded through debt and equity

• Revenues from the data centre should start in eighteen to twenty four months

• Has just announced the launch of Infosys Topaz Fabric

• This is a stack of layered, composable, open and interoperable data infrastructure and AI apps to help and accelerate IT service delivery across enterprises

• Launched Wipro ai360, an artificial intelligence-first innovation ecosystem

• Will integrate AI into every platform, tool and solution used internally

• Wipro has committed to making a \$1 billion investment in advancing AI capabilities

• Management has said that its AI expansion will be led through services rather than investments in infrastructure or proprietary platforms. The set-light model will be built on leveraging client infrastructure

• For the second quarter of FY26, 3% of its revenue came from advanced AI

SOURCE COMPANY ANNOUNCEMENTS, MEDIA REPORTS

firm. The result is that global customers do not see Indian IT services firms capturing a significant share of these early-stage opportunities.

SIDDHARTHA TIPNIS, Partner and Technology Sector Leader, Deloitte India, says the revenue upside from AI will not be immediate but is clearly on the horizon. “Enterprises are already making focused investments in AI services, augmenting existing application landscapes, and launching pilots for more aspirational use cases. A meaningful revenue upside for Indian IT and ITeS firms is expected to materialise in FY26 to FY27, as organisations transition from GenAI experiments

to enterprise-scale deployments,” he says.

Indian IT companies will have to take a call on whether they want to make large AI investments. Given the pressure on margins and market valuations, that is anything but easy. In an interaction with *BT* in August, K. Krithivasan, TCS CEO & MD, said that his company’s financial strength has helped it accelerate capability building in high-growth areas such as AI, cloud, cybersecurity and quantum, while also investing in infrastructure from data centres to AI platforms. “It means we can deliver transformation at scale. For instance, we recently set up an innovation centre in Singapore, expanding our AI research and innovation footprint to 13 hubs globally.”
