

That gap between supply and demand is something the government is trying to address through the India Semiconductor Mission and the ECMS.

India's electronics production has grown from ₹1.9 lakh crore in 2014-15 to ₹11.3 lakh crore in 2024-25, paced by smartphone assembly, computer hardware and telecom equipment.

Even so, domestic value addition, the share of locally made

parts and sub-assemblies, hovers between 18% and 20% of output, about half China's or South Korea's 40%.

The gap is particularly stark in components; India imported nearly \$35 billion worth of parts in FY24, according to the Ministry of Commerce, ranging from PCBs, connectors and sensors to semiconductors—most of them from China, Hong Kong, Taiwan and Vietnam.

To plug the gap and build a robust electronics component manufacturing ecosystem, the cabinet approved ECMS in April 2025 with an outlay of ₹22,919 crore. Within a month of the closure of the application window, MeitY had approved seven projects worth ₹5,532 crore. Kaynes Circuits received approval for four projects along with one each proposed by SRF Ltd, Syrma Strategic Electronics and Ascent Circuits.

HIGH IMPORT DEPENDENCE

THE GAP IS PARTICULARLY STARK IN COMPONENTS;
INDIA IMPORTED NEARLY \$35 BILLION WORTH OF PARTS IN FY24
