

Sokudo is Envisioning Affordable Electric Mobility for Indian Masses

Mr. Prashant Vashishtha, Founder – Sokudo Electric India, talks about his journey, vision, and the EV market in India

What inspired you to venture into the electric vehicle (EV) space, specifically into electric scooters?

The idea for Sokudo Electric India germinated from a mix of necessity and vision. Coming from a humble background, I've always leaned towards sustainable ventures. Around 2017–18, I noticed a gap—urban commuters were grappling with fuel costs and pollution, while the market offered conventional solutions. That's when it struck me—India needs clean, affordable, and reliable mobility. Electric scooters presented the perfect intersection of sustainability, scalability, and service to society.

And how did Sokudo Electric evolve from an idea into a structured enterprise?

It started modestly—with a team of four and unwavering determination. We spent the early days researching global EV trends and tailoring them for Indian roads. I discussed the idea with my younger brother Nishant Vashishtha, and with his support, we finally incorporated Sokudo Electric India in 2021. Since then, we've invested in R&D, set up our own assembly infrastructure, and today we're proud to be a fully indigenous EV manufacturer with high-performance models like the Acute series, built specifically for Indian riding conditions.

Every entrepreneurial journey comes with its share of hurdles. What were the major challenges you faced?

There were several. The first was skepticism—both from consumers and investors. EVs weren't seen as reliable. Infrastructure was lacking. We had to build many systems ourselves—from vendor networks to after-sales. Supply chain constraints were especially tough during and after COVID. Battery sourcing, quality control, and scaling

production cost-effectively were daily hurdles. But our purpose was strong. We weren't just launching scooters; we were building an ecosystem of responsible mobility.

The Indian EV market is becoming increasingly competitive. What opportunities do you foresee in this sector?

India is at the cusp of an EV revolution. As the world's largest two-wheeler market, even a 30% shift to electric means millions of new EVs. The government is enabling this through FAME II, state-level policies, and infrastructure.

Mr. Prashant Vashishtha
Founder – Sokudo Electric India

What excites me most is the growth in Tier 2 and Tier 3 cities. These areas are adopting EVs rapidly—driven by fuel prices and environmental awareness. That's where Sokudo fits. Our scooters are rugged, affordable, and built for long-term use.

We're also exploring B2B partnerships—with delivery platforms, logistics, and fleet operators. EV fleets are the future, and we're ready to power that shift.

In such a crowded market, what makes Sokudo Electric scooters stand out?

Three words: Durability, Intelligence, and

Integrity.

- **Durability:** Our scooters are among the strongest in the market, offering excellent grip, stability, and crash resistance. With a certified load-carrying capacity of over 300 kg, they serve individuals and small businesses.

- **Resilience:** We ensure dust, water, and even mice-proofing—addressing real-world Indian conditions.

- **Smart Features:** Sokudo leads with features like Hill Assist, Walk Assist, Parking Mode, Service Mode, and Self-Learning Mode. We're integrating TFT displays, Google Maps, and Bluetooth diagnostics.

We don't just sell scooters—we deliver reliability, safety, and service excellence.

Your flagship scooters of the Acute series have a bold and bulky design. How do you align that with the expectations of new-age, style-conscious users?

It's about balance. Our design is rooted in "built to last." We focus on strength and performance. But we're also embracing next-gen tech—TFT speedometers, Google Maps, Bluetooth, and ride customization. So, while our scooters appear bold and robust, they're equipped for the new-age rider who values both style and substance. We are also introducing an all-new Select with a sleek design.

What is your long-term vision for Sokudo Electric?

Our mission is simple: to make Sokudo a household name in clean mobility. In the short term, we are expanding our dealership footprint across India and entering international markets. We are investing in advanced technologies—battery intelligence, AI-based diagnostics, and IoT will be part of all future models. By October 2025, our goal is to become moderately profitable, fully self-sustained, and recognized as a trusted brand that creates livelihood opportunities across the EV value chain.
