

AN INFRA BOOST

Overarching schemes to push infrastructure projects

SCHEME	LAUNCHED	PROJECT COST (₹)	PURPOSE
National Infrastructure Pipeline	2019	102 lakh crore	To attract investment in infrastructure project
PM Gati Shakti	2021	15.39 lakh crore	Multimodal connectivity infrastructure to various economic zones
National Logistics Policy	2022	11 lakh crore	Streamlining processes for seamless coordination, and reduction in overall logistics cost
Asset Monetisation Plan	2022	6 lakh crore	Tapping private sector investment for new infrastructure creation

SOURCE GOVERNMENT REPORTS

European Union's Green Freight Programme, could improve efficiency and reduce carbon intensity," he adds.

Vinayak Chatterjee, Founder & Managing Trustee, the Infravision Foundation, an independent think tank, says key things that will drive the future of mobility are ropeways for urban commute, a Unified Metropolitan Transport Authority to manage all city transportation, including roads, buses, and metro systems, aiming for better public transport efficiency and integration and air taxis. Indigo already has a licence for 1,000 air taxis; even airport operators gearing up for the service.

NEW ENERGIES

Energy infra is also expected to undergo major shifts.

Three key future energy investment areas include green hydrogen, battery storage, and pump storage projects.

India has over 233 GW of renewable energy capacity as against an ambitious target of 500 GW of non-fossil fuel capacity by 2030. To support economic growth and electrification of mobility and industry, this capacity would need to expand significantly over the next two decades.

"The integration of utility-scale battery storage, smart grids, and

time-of-day pricing mechanisms may help address intermittency and demand fluctuations. Decentralised solutions like rooftop solar, microgrids, and community-based energy systems could also play a larger role, especially in rural and peri-urban areas. In parallel, the National Green Hydrogen Mission, which targets five million metric tonnes per year by 2030, signals a growing interest in alternative fuels for heavy industry and long-haul transport," says Mishra.

URBAN FOCUS

Urban infrastructure, in turn, will likely need to support both growth and resilience. With urban population projected to exceed 820 million by 2047, cities could benefit from infrastructure that

"We need to focus on developing a robust public transport system that promotes mass mobility and reduces reliance on personal vehicles"
