₹20,000 crore has been committed under PLI schemes between FY21 and FY30—₹6,940 crore for bulk drugs and ₹15,000 crore for pharmaceuticals—according to the Department of Pharmaceuticals. India has a strong manufacturing capacity for formulations—finished drugs and vaccines—but relies heavily on imported raw materials, such as APIs, especially from China. Though it can produce medicines at scale, the supply chain is import-dependent. The PLI push is expected to boost local API and device production.

“We are seeing signs of the ‘China+1’ strategy playing out, especially in formulations and select API (active pharmaceutical ingredient) segments. Global companies are actively looking to diversify their supply chains, and India is a natural choice given its strong regulatory track record and manufacturing base,” says Bhavin Mukund Mehta, Vice-Chairman, Pharmexcil. Despite manufacturing bottlenecks, India’s medical value travel (MVT) market is rebounding post-Covid and is projected to expand significantly. According to Future Market Insights, the Indian MVT market, valued around \$10.2 billion in 2023, is expected to touch \$58 billion by 2035. In FY24 alone, over 7.3 million foreign patients visited India for treatment, contributing an estimated \$7.7 billion to the economy, according to the data. High-end treatments like oncology, cardiac surgery, transplants, in vitro fertilisation, and orthopaedics remain the top draws. India has renewed appeal as an affordable, high-quality healthcare destination.

Indian hospital chains are expected to add nearly 100,000

initiatives like vaccine monitoring digital platform CoWIN, production-linked incentive (PLI) schemes, and faster regulatory clearances—enabled faster innovation and rollout.

“With the world’s largest digital health mission, a surge in med-tech innovation, and a generational shift toward wellness and longevity, India is poised to become the global epicentre of inclusive, intelligent healthcare,” says Dr Sangita Reddy, Joint Man-

aging Director, Apollo Hospitals. According to Pharmexcil, pharmaceutical exports reached \$27.9 billion in FY24, compared to \$20.6 billion in FY20, the last full fiscal year before the pandemic. This growth reflects India’s expanding global footprint in the pharmaceutical sector, with the United States remaining the top export destination, accounting for 31% of total pharmaceutical exports.

To reduce India’s 65% import dependence on bulk drugs, over
