But with Zero Knowledge tech, that changes. Now, you can have all the benefits of Web3 and full control. So, imagine this. The government of India builds a single blockchain, and all government systems—starting with a few, then eventually everything—run on it.

Everything becomes interoperable, tamper-proof, and incredibly fast. On a blockchain, a fake certificate doesn't get created. It's not possible. And in any case, where there's a discrepancy, the police can access the real data directly, without needing to pull in ten other depart-

ments. They can see what's right and act immediately.

This brings transparency to the justice system, reduces the workload, and delivers justice faster. And more importantly, we could design it to meet our specific needs while keeping full control and governance within India.

These are the kinds of real problems that blockchain is built to solve. India already has 17% of the world's Web3 developers. We are helping build the future, yet still relying on infrastructure we don't fully control. Why not offer our developers a sovereign, secure, and open network of our own? One that is built for scale, energy-efficient, open source, and ready to connect with the global ecosystem.

We would finally have a blockchain network that reflects our values, priorities, and goals.

But above all, what excites me the most is the kind of trust this could bring. In a country where systems often fall short, where land disputes or identity issues can drag on for years, blockchain offers something powerful. It brings transparency. It brings speed. It brings confidence.

And the best part is that we do not need to start from zero. We can learn from what has worked around the world and shape it to fit India's unique needs.

As we imagine what India will look like at 100, we should not be satisfied with just participating in the digital future. We should lead it. Let's build a blockchain network that belongs to every Indian. One that can strengthen public infrastructure, spark innovation, and ensure no one is left behind.

It's time. **BT**
