### DEDICATED ZONES FOR RARE EARTHS

► To boost rare earth production and strengthen the supply chain, the government should fast-track mining projects by simplifying clearances and environmental approvals, offering financial incentives, and setting up dedicated industrial zones for rare earths. Encouraging research in new extraction methods and e-waste recycling are also crucial. Collaborating with global partners for tech access, alternative supply sources, and developing skilled manpower will support long-term growth.

### ALIGN GRADING WITH GLOBAL STANDARDS

► India must stamp its products with quality benchmarks such as ISO and BIS to become a global manufacturing and export hub. This is specifically important in high-value sectors such as medical devices, electronics, pharmaceuticals and automotive, where global buyers look for traceability, safety and certification. This will not only improve India's export acceptance but also enhance consumer confidence. The government must promote industry training and incentivise certification.

### SINGLE-WINDOW FACTORY APPROVAL

► Setting up a factory in India still involves too much paperwork. What's needed is a single-window system that actually works—bringing together state and central approvals in one place, fully online and with strict timelines. Smaller towns should be allowed to define their own industrial zones. With simpler zoning laws and fewer roadblocks, these towns could become the next manufacturing hubs.

### MAKE INDIA THE GLOBAL FINANCIAL HUB

► India needs to step up if it wants to be the go-to spot for global holding firms and innovation centres. The GIFT City IFSC is a decent start—tax-friendly, with fewer hoops to jump through. But here's the catch: capital gains, angel tax, GAAR, and double taxation still spook investors. No surprise then that firms still prefer Singapore or Dubai. If the government provides clarity, India could have a real shot at keeping that capital at home.
