IMPOSE A GREEN MANUFACTURING MANDATE

► India has a decarbonising road map with a 2070 net-zero target, which means manufacturing, a key growth parameter, needs to transition to sustainable measures. Sectors like steel, cement and metals are investing in eco-friendly options, but unless there is a clear government mandate, adoption of these products will be slow. Keeping in mind the high cost of manufacturing low carbon products, a mandate will provide a glide path to manufacturers and customers.

SMOOTHEN TRANSITION FROM FOSSIL FUELS

► Bring out a comprehensive policy to protect rights and livelihoods of workers in regions reliant on fossil fuels. States and the Centre have done some work in the area but there is a need for a national policy that lists the transition's pace, shape, scope, coverage and timeline for certainty regarding measures that will be adopted. There must be an assessment of the impact of the transition for targeted strategies and financing.

GREEN HYDROGEN THRUST

► The massive renewable energy capacity expansion in India was the result of government policies such as purchase obligations that require obligated entities to buy minimum units from renewable energy producers. Green hydrogen is seen as game-changer but comes at a high cost. A purchase mandate can increase its adoption.

MAKE CARBON TRADING A REALITY

► India is rapidly advancing towards a structured and regulated carbon pricing ecosystem. With increasing global emphasis on carbon markets like Carbon Border Adjustment Mechanism, India is developing a rate-based Emissions Trading System and voluntary carbon crediting mechanisms. The focus should be on raising awareness among MSMEs, bringing a policy on the risk of double counting and fraud.
