BUILD INDIA'S AI BACKBONE

► No digital revolution can thrive on imported hardware and outsourced ethics. While India has earmarked \$1.2 billion for its AI mission, this pales in comparison to the tens of billions invested in the US and China. To stay competitive, India must urgently scale up investments in domestic chip fabs, public compute infra, and sovereign cloud systems. From training LLMs to safeguarding national security, compute sovereignty isn't optional, it's foundational.

**A DIGITAL CONSUMER PROTECTION LAW FOR THE AI ERA, PLEASE**

► As the AI era booms and digital services surge, India must enact a strong Digital Consumer Protection Law focusing on user consent, algorithmic accountability, data portability, and cyber safety. Such a law would ensure consumers control how their data is used, make companies accountable for algorithmic decisions, and empower users to move data between platforms securely. It's crucial for safeguarding privacy, promoting fair competition, and building trust.

FROM STEM TO STEAM

► Teach AI and ethics, not just code. India's citizens must think beyond pure science. It's time to add arts, ethics, climate science, digital civics, and systems thinking into curricula. Adding AI and arts to STEM (science, technology, engineering, and mathematics) and making it STEAM nurtures critical thinking, empathy, and responsible innovation. From middle school, students should understand AI biases, sustainability, and societal impacts. Doing this will ensure India's workforce can lead ethically.
