MANDATE TECH IMPACT AUDITS FOR START-UPS

► India should pioneer mandatory “Tech Impact Assessments” for AI, Web3, and other disruptive technologies, akin to environmental clearances. Start-ups must evaluate and disclose risks like bias, privacy harm, misinformation, and social disruption before launching products. Ethics-by-Design becomes a competitive advantage rather than an afterthought. This reform will protect citizens while building global trust in Indian innovation.

95

ONE INDIA, ONE DIGITAL ID

► Imagine seamlessly accessing banks, hospitals, universities, and apps using one consent-driven digital identity. India’s unified digital identity layer can empower citizens with “one identity, many verifiable credentials.” APIs would enable both government and private services while giving users granular control over data sharing. This reform ensures efficiency, security, and trust. A unified identity architecture could transform how Indians transact, learn, and receive services, both online and offline.

COMPREHENSIVE CYBERSECURITY FRAMEWORK

► India urgently needs a modern, comprehensive cybersecurity framework. The digital economy’s growth has outpaced the laws that protect users, infrastructure, and data. New legislation should define cybercrimes, establish strict penalties, enforce data protection, and outline incident reporting protocols. It must balance national security with privacy rights. A robust cyber law will fortify India’s digital assets, boost investor confidence, and safeguard citizens.

TRANSPARENT CRYPTO RULES

► India’s crypto ecosystem sits in regulatory limbo, stifling innovation and investor confidence. Clear rules are essential for cryptocurrencies, stablecoins, and tokenised assets. The government must define taxation, compliance, and consumer protection while mitigating financial risks. A transparent policy could attract blockchain innovators, prevent capital flight, and integrate India into the global digital economy.
