

“We aim to improve workflow, patient experience, and clinical outcomes—not just sell devices. That is how we help hospitals boost productivity and maintain cost-efficiency”

co-create solutions that enhance workflows and patient experiences. While both organic and inorganic growth are on the table, India offers significant scope for organic expansion. We will continue investing in capabilities and partnerships to meet the healthcare sector’s evolving needs.

Q: As more cost-efficient players enter the healthcare space, how does Philips plan to stay competitive while continuing to innovate and bring care closer to the patient?

A: While many new players offer cost-efficient solutions, we focus on delivering value through innovation, not simply price competition.

We offer an integrated ecosystem, supporting partners across the care continuum from workflow design to patient engagement. For example, our SmartSpeed MRI technology improves image quality and scan speed. Performing five extra scans per day with the same machine delivers a better return on investment than reducing upfront cost.

We aim to improve workflow, patient experience, and clinical outcomes—not just sell devices. That is how we help hospitals boost productivity and maintain cost-efficiency without compromising quality.

We are also aligned with the Make in India initiative. We are not only manufacturing in Pune, Baddi, and Silvassa, but developing innovations here as well. Our research and development centre in Bengaluru is producing solutions for both local and global markets.

Q: How is Philips tapping into Tier II and Tier III cities while addressing the unique demands of these price-sensitive regions?

A: These cities offer significant potential, particularly as entrepreneurial doctors set up and expand healthcare facilities. Their needs differ from large hospital chains, so our approach is tailored.

We support them in three ways. First, we guide them in selecting scalable technology, ensuring, for example, that MRI equipment can support their growth from 50 to 100 beds. Second, through Philips Capital, we provide financing options that ease upfront investment burdens.

Third, we offer fit-for-purpose products like the Zenition 90 motorised mobile surgery unit, which serves as a more affordable alternative to conventional Cath labs, and artificial intelligence-enabled ultrasound machines that simplify use. **BT**
