

# THE PRODUCTION TARGET

- Electric locomotive production has risen with nearly 9% jump expected in FY26
- A record number were produced in FY25

# BUDGET FOR LOCOMOTIVE PRODUCTION

- Budgetary allocation is increasing gradually
- FY26 saw a jump of over 20% for all three units

|                 |         |         |
|-----------------|---------|---------|
| CHITTARANJAN LW |         |         |

electric locomotive demand of the Railways. Alstom delivered its 500th 12,000 horsepower (HP) engine early this year, while Siemens is starting its production line for 9,000 HP electric engines in Dahod. Both are one of the most powerful freight locomotives in the world. For Siemens, approximately 90% technologies in locomotives are made in India with factories in Nashik, Aurangabad, and Mumbai manufacturing critical components, with final assembly, testing and commissioning performed at the Indian Railways’ factory in Dahod.

Sunil Mathur, Managing Director and Chief Executive Officer, Siemens Ltd, says the company takes pride in partnering with the Railways in this prestigious project.

“Together with the Railways, we have been able to construct a world-class factory. The introduction of these advanced locomotives is crucial to realising the government of India’s aspiration to elevate the Railways’ share in freight movement from 27% to around 45%,” says Mathur. On the other hand, Alstom’s 12000 HP locomotives are being built at one of India’s largest integrated green-field manufacturing facilities at Madhepura (Bihar), under a joint venture with the Railways.

This is the largest foreign direct investment project in the railway sector. The facility has an installed production capacity of 120 locomotives per annum. Alstom has progressively achieved nearly 90% localisation.

The production ramp-up has clearly begun, but it will take time for the demand-supply gap to narrow. **BT**
