

And because we can take a long-term view, we align our investments with what clients will need tomorrow.

Q: As a tech-led company, how do you deal with disruption and yet create it yourself?

A: Dealing with disruption and driving it are two sides of the same coin. On the one hand, we are deeply embedded in our clients' realities, helping them optimise costs, manage risks and adapt to ever-shifting technology cycles. With AI, for instance, the opportunities are immense, not only in enhancing delivery and accelerating technology adoption but also in democratising access so that its benefits reach society at large.

On the other side, we have built AI-powered platforms that are already helping clients reimagine everything from supply chains to retail pricing and energy efficiency. Our centres of excellence and delivery units are constantly developing new industry-specific solutions, whether in BFSI, telecom, manufacturing, or healthcare.

Q: There must be other things you must be doing here...

14 | A: To further strengthen our ability to navigate this fast-changing environment, we have recently appointed a Chief Strategy Officer to help us build and adapt an evolving strategy that keeps us ahead of market shifts and a Chief Operating Officer to further enhance our operational excellence. In today's dynamic business climate, where technology cycles are accelerating and client expectations are evolving in real time, these roles are critical for ensuring that strategic foresight and flawless execution go hand in hand.

We also invest in emerging technologies ahead of the curve: agentic AI, digital twins, physical AI, so we influence markets rather than simply respond to them. Our partnerships with players like NVIDIA, Microsoft, Google Cloud, and AWS, are accelerators in this journey.

Q: What will the revenue and profitability drivers be for TCS?

A: The evolving technology landscape provides multiple opportunities for growth. The first and most important driver will be AI-led transformation at scale. We are moving beyond pilot projects to full-scale enterprise adoption of AI across industries. Our dedicated AI & Data unit, industry-specific AI centres and proprietary platforms will power this shift, enabling clients to improve productivity, accelerate decision-making, and innovate at an unprecedented pace.

“With NVIDIA, we have a dedicated unit combining their tech with our domain expertise to deliver industry-specific AI solutions across sectors like telecom, manufacturing, etc”

By embedding AI into every stage of the value chain, we can help organisations unlock entirely new business models and revenue streams.

Complementing this will be industry-specific solutions that address complex challenges in sectors such as BFSI, manufacturing, healthcare, retail, and telecom.

Another key driver will be Cloud modernisation and integration. Many enterprises are accelerating their Cloud journeys, and we expect this to continue, often in tandem with AI adoption. Then there is cybersecurity. As data becomes the core of every enterprise, safeguarding it is no longer optional—in fact, it is critical to business. We see rising demand for advanced solutions such as sovereign cloud, zero-trust architectures, AI-powered threat detection, and managed security services. Responding to this, we recently launched a cloud platform for government and public sector enterprises to host mission-critical applications and protect sensitive data.

In India, there is a strong focus on indigenous technology leadership. TCS is playing a leading role in this self-reliance, including pioneering the country's first domestically produced semiconductor chips in partnership with Tata Electronics. We are partnering with IBM and the government of Andhra Pradesh to build India's largest quantum computing hub. These initiatives combine our strengths in chip design, AI, and Cloud to build a resilient, future-ready ecosystem. Lastly, operational excellence and workforce productivity will remain central to sustaining profitability. By combining human expertise with AI-enabled delivery models, automation and continuous skilling, we can ensure that growth is both sustainable and efficient for the long term. **BT**
