A big part of the Indian banking sector's growth has come from making technology indispensable. Vaidyanathan says scale with technology can help us serve more customers. "We can increase our reach since 51% of our branches are in semi-urban and rural areas. Today nearly 90% of our branches sell home loans. This, in turn, has enabled us to garner more liability relationships."

For ICICI Bank, scale is about deepening presence across markets and consistent growth. Its spokesperson says its network (7,066 branches), with 13,376 ATMs, is a serious adopter of technology. "The bank leverages this apart from digital channels, partnerships and overseas coverage of India-linked business to drive growth."

Amidst all this, the sector at the centre of so much transformation, information technology, is also focusing on increasing the size while keeping an eagle eye on profits. Tata Consultancy Services CEO & MD K Krithivasan says the businesses must adapt to transformation driven

by emerging technologies, shifting customer expectations, and sustainability goals. "In this context, a strong balance sheet is not just a safety net but a channel for long-term sustainability and strategic decision-making. TCS' positive cash flows, strong margins, and capital structure give us the flexibility to invest in growth without compromising on stability," he says. In the time to come (and that will be for a long time), all eyes will be on AI and its impact. "It is obvious that future growth for the sector will depend on the AI story," says Geojit's Nair.

Growing on a large base is not easy and as India's GDP takes the fourth spot, the journey has barely begun. Bolinjar says the number can easily double. "It puts India in a sweet spot, but we must get it right on the execution front," he says. As India Inc moves into top gear, the time for that could not have been better. **BT**
