

Dr Sudhir Srivastava - The Man on a Mission to Make Advanced Surgical Care Accessible for All

was the first single-vessel beating-heart TECAB in the United States. He is also the only surgeon to have performed a quadruple-vessel beating-heart TECAB at the University of Chicago.

His legacy, however, extends beyond surgical milestones. His deeper impact has come from seeing a larger problem in healthcare. Advanced surgery existed. Clinical excellence existed. What remained broken was access! For too many patients, especially in India and other emerging markets, the best technology was either too expensive, too urban-centric, or too dependent on imported systems to become widely usable. That gap between possibility and affordability is what Dr. Srivastava chose to address through entrepreneurship.

The result was SS Innovations International (SSII) and its flagship SSI Mantra surgical robotic platform. It is an indigenous, advanced, modular, multi-specialty robotic surgery platform developed to increase access and improve outcomes across a wide range of procedures. It represents a strategic shift in how India is participating in global medtech, especially with SSII's uplisting on Nasdaq last year. Furthermore, SSII is targeting FDA and CE Mark clearance this year, which will lead to its entry into the USA and European markets.

Instead of remaining a buyer of high-cost imported systems, India is now designing, building, and scaling high-value healthcare technologies of its own.

Making Advanced Healthcare Accessible at Scale

What distinguishes Dr. Srivastava's work is that he has treated affordability as a core design principle rather than an

When an indigenous robotic surgical platform developed by an Indian company enables a cardiac procedure to be performed across nearly 20,000 kilometres, from Georgetown, Guyana, to Indore, India, it does more than set a world record. It challenges one of healthcare's oldest limitations - distance.

This historic milestone was achieved using the SSI Mantra surgical robotic system developed by SS Innovations International (SSII), with Founder and Chairman Dr. Sudhir Srivastava remotely performing a Left Internal Mammary Artery takedown from Guyana during the inauguration of the country's National Robotic Surgery Programme. The procedure marked the world's longest-distance telesurgery.

As India moves toward the vision of a Viksit Bharat, this breakthrough raises one of the most important questions

for nation-building: can world-class healthcare truly be made accessible beyond elite hospitals and major cities?

A truly developed nation cannot grow without a healthcare system capable of supporting every life, regardless of economic, social, or cultural status. For Dr. Sudhir Srivastava, this is not a policy debate. It is the mission that has shaped his life's work. Through SSII, he has built an indigenous surgical robotics ecosystem designed to make advanced healthcare more affordable, accessible, and scalable across India and beyond.

From Surgeon to Visionary

Dr. Srivastava's journey began in medicine, but his leadership story extends far beyond the operating room. A globally acclaimed robotic cardiac surgeon, he built his reputation by pushing the frontiers of minimally invasive cardiac surgery. Among his early achievements
