

afterthought. SSI Mantra was introduced at less than one-third the cost of incumbent robotic systems in India, with service contracts and consumables also positioned at a significant cost advantage. In a country where affordability is often the difference between delayed treatment and timely care, SSI Mantra changed the equation dramatically.

The numbers now point to real momentum. SSII has now completed more than 11,300 surgeries using the SSI Mantra system, including over 500 cardiac procedures, about 175 telesurgeries, and 125 pediatric surgeries. The company has also expanded to more than 210 installed systems across 11 countries. These figures reflect more than commercial traction. They suggest that a new model of advanced care, designed in India but accessible globally, is beginning to take shape.

Dr. Srivastava has also placed major emphasis on training, understanding that no technology can transform healthcare unless hospitals and clinicians are equipped to use it well. SSII's training ecosystem includes didactic programmes, simulation, hands-on sessions, proctoring, and continuing

support, with roughly 2,100 physicians trained on the platform so far. In effect, he is not simply selling surgical systems. He is helping build the capabilities needed to sustain a broader robotic surgery culture.

A Surgical Ecosystem Built to Boost India's Healthcare Capabilities on the Land and the LOC

The platform is now evolving into a broader ecosystem. Alongside SSI Mantra, the company has introduced the MantraM mobile telesurgery bus and the compact MantrAsana telesurgeon console (a fully equipped telesurgery chair), designed to support mobility and remote intervention.

At the third edition of the Global Robotic Surgery Conference, SMRSC 2026, the company unveiled two breakthrough surgical platforms, Project Operion and SSI Vimana. Project Operion is a deployable robotic surgical unit for battlefield care, mobile field hospitals, and telesurgical command support. The mobile surgical truck can reach challenging terrains and provide immediate healthcare support at the LOC. SSI Vimana is a drone-deployed trauma response sys-

tem that integrates with MantrAsana to extend robotic surgical capability to disaster zones, inaccessible terrains, and combat environments.

A Viksit Bharat Needs Healthcare Without Barriers

What began as a surgeon's pursuit of clinical excellence evolved into a mission to make advanced healthcare accessible at scale. Driven in part by a haunting encounter with the family of a young woman who could not afford life-saving cardiac surgery, Dr. Sudhir Srivastava set out to ensure that affordability and geography would no longer determine a patient's access to world-class care.

Today, through SS Innovations International, he is building far more than a robotic surgery platform. He is creating an indigenous healthcare ecosystem that spans advanced surgery, telesurgery, physician training, and remote medical intervention. As India moves towards becoming a Viksit Bharat, his vision offers a powerful blueprint for the future where cutting-edge healthcare is not confined to a few urban centres but reaches every corner of the nation.
