OVERCOMING BOTTLENECKS

○ **500 GW non-fossil fuel target by 2030**

○ **Nearly 280 GW of solar contribution from the current 150 GW**

○ **Solar accounts for 28% of installed**

capacity

○ **India has met about 80% of its transmission planning targets**

○ **300 GWh of solar energy curtailed in Q1CY26**

projects start much faster, often within 12–18 months. As a result, transmission infrastructure development is lagging renewable energy deployment.

“Overloading of the transmission system takes place during summer months at some of the locations, because of which some of solar and wind plants cannot evacuate full power. This is more seasonal. Some of the transmission lines that are in the pipeline, once executed, will take care
