LEADER**

○
ONGC has set a target
of achieving operational
net-zero for Scope 1
and Scope 2
emissions by 2038

○
It has put in place a
three-phase transition
road map with a total
outlay of ₹2 lakh crore

○
The company has
commissioned
250 MW of new wind,
solar and hydro capacity
in the last six weeks

○
In the first phase of its
transition road map, it
plans to halve absolute
emissions by 2030

○
It is working on India's
first geothermal
energy development
project in Ladakh

BUILDING AN INTEGRATED ENERGY GIANT

ONGC has committed ₹2 lakh crore by 2038 across
a structured set of decarbonisation levers

BY **RICHA SHARMA**

A **S INDIA DOUBLES** down on its sustainability targets, companies across the country are moving fast to improve their own performance on this front. It's no different at Oil and Natural Gas Corporation (ONGC), the country's largest oil and gas producer, and the Disclosures & Transparency Leader in BT India's Most Sustainable Companies 2026 ranking.

It has set a target of becoming an integrated energy company in the next 25 years with a transition road map that includes improving energy efficiency, flare reduction, adding renewable capacity, green hydrogen, green ammonia, compressed biogas, offshore wind, pumped storage and carbon capture, utilisation and storage (CCUS). For this transition, it expects to make a cumulative investment of ₹2 lakh crore by 2038.

These are not isolated projects, they are sequenced across short, medium and long-term horizons. The road map looks at low hanging fruit for quick results. In the short term up to 2030, it is focusing

on areas that can deliver credible and measurable impact early. This includes producing 3.89 GW of renewable energy, building 25 compressed biogas plants, setting up 0.5 GW offshore wind capacity and 1 GW pumped storage.

Besides, it is laying strong emphasis on reducing gas flaring, or the burning of the natural gas associated with oil extraction. This is done by capturing the gas instead of burning. It helps lower greenhouse gas emissions and prevent hazardous waste.

In the first phase, the company intends to reduce absolute emissions by 50%.

In the medium term, from 2030 to 2035, it plans to move deeper into newer energy systems, including green hydrogen and green ammonia, additional renewable capacity and pumped storage.

The long-term phase, leading up to 2038, all these are expected to come together to form a cohesive system through further offshore wind capacity, continued renewable build-out, additional green hydrogen and ammonia, and expan-
