economy loops in Indian manufacturing.

Further, ACC also remained water positive at 1.7 times in FY 2026, which means it replenished more water than it consumed. It harvested over 7.6 million kilolitres of rainwater across its sites, supported by a network of conservation and recycling initiatives.

ACC's performance on this front is among the more tangible demonstrations of its sustainability commitments translating into measur-

able outcomes.

"Sustainability at ACC extends beyond plant operations into logistics, which is a significant contributor to emissions in the cement value chain. The Company is progressively optimising its logistics network through a combination of modal shifts, infrastructure investments, and digitalisation," the company official said.

Logistics is one of the most emissions-intensive parts of the cement value chain, and it is an area that of-

ten escapes scrutiny in discussions about green manufacturing. ACC has been building a green logistics architecture as part of its production strategy.

The company operates a marine network comprising 10 bulk cement terminals and seven port-based grinding units, supported by a growing fleet that includes seven new vessels with over 65,000 DWT of capacity. This enables a significant shift of freight from road to sea, one of the most carbon-efficient modes of bulk transport available.

Through the Adani Foundation, the company reached nearly 2.76 million people across 11 states in FY 2026, with a social investment of Rs 44.67 crore. The programmes span education, healthcare, livelihoods, women's empowerment, and environmental sustainability. "These initiatives are focused on addressing practical challenges at the ground level and designed not only to address immediate needs but also to build long-term resilience in communities around plant locations," the company official added.

In water-stressed regions around its plants, ACC has supported rainwater harvesting and groundwater recharge programmes that directly benefit agricultural communities, benefiting not just the company's water goals, but also the farmers and families who live around its plants. "Overall, the company's approach is to create measurable impact through sustained engagement, while strengthening long-term community resilience around its operational areas," the official added.

In an industry often seen as part of the climate problem, ACC is making a credible case for being part of the solution. **BT**
