trolled cabins. Women from the surrounding fishing and coastal communities, many of whom had no prior formal employment, are now trained operators managing some of the most sophisticated cargo-handling equipment in the country.

"We are accelerating the transition towards low-carbon operations through renewable energy adoption, electrification and energy-efficient technologies, while

continuing to invest in ecosystem restoration across our coastal assets," the official said.

The energy transition is central to that ambition. APSEZ is accelerating the shift to renewable power across its port assets, combining solar and wind procurement with the electrification of port equipment and the adoption of energy-efficient technologies.

The results are measurable: emission intensity has been re-

duced by 29% over the past five years, including a 12% decrease in the most recent year alone, as per APSEZ's Climate Action Report 2025. At Mundra Port alone, 11 kVA shore power systems now supply auxiliary power directly to docked tugboats, significantly cutting diesel consumption and associated emissions.

Further, the Adani Mundra Cluster, encompassing operations across APSEZ, Adani Enterprises and Ambuja Cement, is positioned to become one of the world's largest green hydrogen hubs, targeting production of 1 million metric tonnes per annum (MMTPA) by 2030 and 3 MMTPA by 2040.

The circular economy ethos extends to waste management as well. In FY2025, APSEZ reused and recycled 42% of its total waste, with an additional 33% successfully recovered and processed. Twelve of its domestic ports have now attained 'Zero Waste to Landfill' certification, a benchmark that reflects both operational discipline and a deeper commitment to leaving port ecosystems intact.

By 2030, APSEZ has committed to achieving no net loss of biodiversity across its operations. By 2040, it aims to be net biodiversity positive, meaning its operations will, on balance, leave ecosystems better than they found them. Also, by 2040, it plans to achieve its net zero emissions target, placing the company a decade ahead of many peers on the carbon timeline.

APSEZ has also earmarked ₹1,500 crore for the future decarbonisation projects, including renewable energy and green port development, backed by a Board-approved investment roadmap. **BT**
