

EMISSIONS CHALLENGE

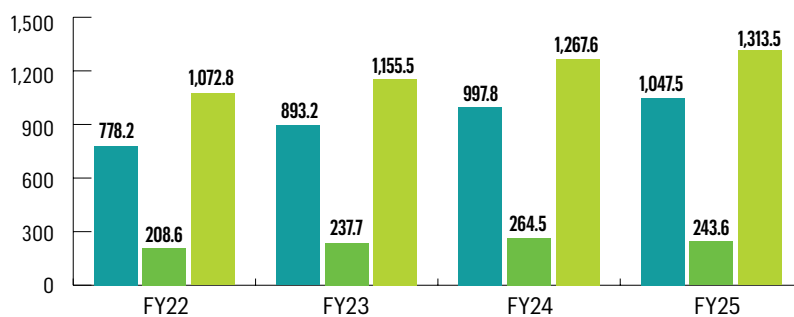

- Rapid clean energy deployment keeps emissions in check
- Emissions are expected to increase in 2026 with the switch back to fossil fuels

■ 2024 ■ 2025 **NOTE** CARBON EMISSIONS IN TONNES OF CARBON DIOXIDE; FIGURES IN BUBBLES ARE YOY PERCENTAGE CHANGES **SOURCE** IEA

COAL CHARGE

- Coal consumption has been rising in recent years
- Dependence on imported coal in industries continues due to high ash content in Indian coal

■ PRODUCTION ■ IMPORT ■ CONSUMPTION

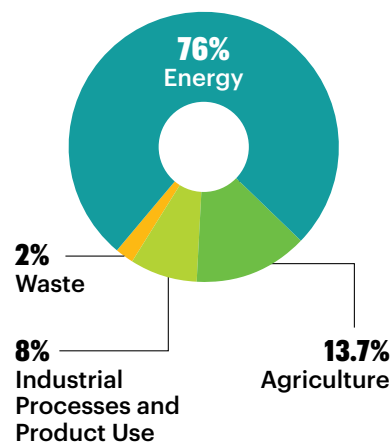

NOTE ALL INDIA COAL PRODUCTION, DEMAND AND IMPORT IN MILLION TONNES

SOURCE MINISTRY OF COAL

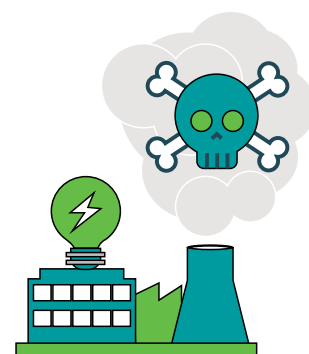

ENERGY SECTOR HAS HIGHEST EMISSIONS

- Energy sector, including industrial demand, remains the biggest emitter
- Agriculture, with high methane emissions, adds to emissions

SOURCE ENVIRONMENT MINISTRY

power. India added a record 15.3 GW of solar capacity in the first quarter of 2026.

CORPORATES STEP IN

Among the first movers was Jindal Steel Ltd. In April, the company

announced that it would embrace coal gasification technology to enhance energy self-reliance and sustainable steel production.

The company has achieved a world-first by establishing India's premier coal gasification-based

Direct Reduced Iron (DRI) plant. This facility utilises syngas rather than traditional fossil fuels for iron making, according to the company.

"Syngas from swadeshi coal can replace imported methanol,
