

THE BREAK-UP

- Thermal retains the highest share in installed energy capacity
- Solar power has seen massive growth in the past few years

CATEGORY-WISE INSTALLED CAPACITY

SOURCE NATIONAL POWER PORTAL

COAL AND OIL DOMINATE

- Fossil fuels make up three-fourths of energy supply
- Clean energy sources have a long way to go

PRIMARY ENERGY SUPPLY

NOTE OTHERS INCLUDES NUCLEAR AND HYDROELECTRIC, **SOURCE** NITI AAYOG

ammonia, ammonium nitrate, and LNG. India must utilise its vast coal reserves to future-proof low-carbon growth and reduce forex outflow,” says PK Biju Nair, Executive Director of Jindal Steel’s facility in Angul, Odisha.

The company has also deployed syngas in its galvanising, colour coating line furnaces, a first for the global steel industry, and has injected syngas into blast furnaces.

Simultaneously, the company is working on green pathways. By 2030, it has a target of reducing CO₂ intensity by 30%, increase renewable energy to 50% and ensure full biodiversity coverage across all sites. In the decade to 2040 it will scale hydrogen circularity and carbon capture and storage (CCS) infrastructure.

Apart from steel, the West Asia conflict has also hit energy feedstock supplies for sectors such as ceramic, cement, urea and other high-heat processing units. Some companies in those sectors, too, have decided to increase the coal share in the fuel mix.

Atul Daga, Chief Financial Officer of UltraTech Cement, says the company is actively managing its fuel mix, optimising between pet coke, coal, alternative fuels, and increasing the share of domestic coal wherever required and possible. About 43% of Ultratech’s power requirement is met from green sources, which the company plans to increase to about 85% by FY30.

Elsewhere, too, the importance of coal is being appreciated anew. In the power sector, though India

has paused the addition of thermal plant capacity, the country announced an expansion of existing thermal capacity in 2024 to meet the growing electricity demand. India’s peak power demand touched 270 GW on May 21, an all time record as a result of soaring temperature, compared to 243 GW peak demand in 2025.

S.B. Khyalia, CEO of Adani Power, the largest private thermal power producer, says the world has come to realise that fossil fuel-generated power cannot be just wished away.

“It has a crucial role to play in balancing the grid as renewable energy penetration increases. As our power needs become more intense, it is reliable and domestic energy sources like coal that come to our help and provide electricity
