

How STT GDC India has Emerged as the AI Enabler in the Enterprise Ecosystem of India

Bimal Khandelwal
CEO
ST Telemedia Global Data Centres (India)

India's digital transformation, having picked up inexorable momentum over the last few decades, has reached a tipping point, where the future pathways will largely determine the national journey itself with global ramifications. **History has shown that the trigger and sustenance**

of a new industrial age can often be traced back to a paradigm shift in infrastructure and technology. The Industrial Revolution had railroads, the telecom boom had fiber networks, and today's AI-driven economy demands robust digital infrastructure. Infrastructure is the bedrock for innovation and sustained progress, and it's no different for the new digital economy. Take India's telecom sector. Strategic investments made it the world's second-largest market,

enabling internet penetration at leapfrogging pace, e-commerce, digital payments, and a myriad other services. It is inconceivable to imagine this growth without the necessary towers, spectrum, fiber assets – the underlying infrastructure. **A digital economy cannot scale without the backbone to support it.**

On the subject of scale, India is set to generate over **45 zettabytes of data, conservatively, every year by the turn of the decade.** The computing power required to create economic value addition on this data for businesses, individuals, and the government will require infrastructure that is of an order of magnitude higher than what exists in the country today. Without scalable and AI-ready infrastructure, the economy will hit a bottleneck, limiting innovation and competitiveness.

As someone who has witnessed this evolution first-hand from the prism of the journey of the Telco sector I can vouch that digital transformation without digital infrastructure is a paper tiger. While telco infrastructure in India has been revolutionized with a multi decadal effort and tens of billions of dollars of investments, the other critical part of digital infrastructure – data centres are only getting started.

Data centers power everything from financial transactions, real time communications, analytics, productivity applications, everything that makes digital tick. Despite their criticality, India faces an acute data centre infrastructure gap, the ecosystem is still evolving, and unlike telecom, it lacks decades of structured investments. We must act now to build at scale, ensure sustainability, and enable AI-ready ecosystems that secure India's digital future.

At **STT GDC India**, we are not waiting for this shift—we are leading it by ensuring that new-age businesses have the AI-ready, high-performance infrastructure they need to succeed in the new digital paradigm.

The Changing Face of Computing

Over the years, the nature of digital's play in the economy has transformed significantly. This transformation, driven today by AI, ML and sensorification impacts sectors with the promise of adding trillions in dollars of value to the global economy in the coming years enhancing factor productivity, innovation and governance. The new age of digital has the potential to revolutionize
