

healthcare, agriculture, manufacturing, public services; it is already evident in content creation, banking, R&D and many others. Underlying and enabling this shifting paradigm in digital transformation is the changing nature of compute. The world's fastest supercomputers boasted a few million gigaflops of processing power under a decade back; now we measure them in upwards of a billion gigaflops.

The democratized availability of accelerated computing to consumers and enterprises alike is the new normal and that has tremendous implications for the underlying infrastructure if we are to successfully and sustainably harness its potential. Traditional workloads that once required modest computing resources have given way to new-age applications running on the accelerated compute infrastructure that demands power, cooling, and connectivity on a scale hitherto unseen.

At STT GDC India, we recognized this paradigm shift early and have built ourselves not just as data centre operators, but as true enablers of India's new age digital ambitions and the bedrock of enterprise transformation for the new age.

Building for Today's Demands and Tomorrow's Possibilities

One of the most important advancements in our strategy has been reimagining what the data centre of tomorrow should look like and building that infrastructure today. The nature of the building, the available power, the complex cooling, electrical, mechanical and connectivity infrastructure

Our facilities are built grounds up in terms of the strengthened building specifications and far more enhanced power requirements to support the IT infrastructure. Our server halls with the associated MEP & cooling architecture now support rack densities ranging from 4 kW to an industry-leading 120 kW per rack—a necessity for the intense computational requirements of machine learning, AI training and inference workloads.

This capability has been developed through a fundamental redesign of our infrastructure across the spectrum of construction, mechanical, electrical and cooling technologies. Specific to the latter, We've implemented a comprehensive suite of cooling technologies, including In-row Cooling, RDHX, Liquid Immersion Cooling and Direct-to-Chip Liquid Cooling. These advancements represent our commitment to addressing infrastructure barriers that could hinder India's achievements in digital transformation journey.

I remember walking through our first high-density data hall, feeling both pride in what we had accomplished and excitement about the

breakthroughs it would enable for our customers. Today, that vision has materialized as we support some of India's most ambitious AI deployments.

Operating Excellence as a Competitive Advantage

Building advanced infrastructure is only one facet of the equation. The operational complexity of managing high compute workloads demands specialized expertise and rigorous processes. We've invested heavily in developing a workforce with the skills to support these demanding environments and revamping processes, leverage automation and continue to do so, implementing best-in-class Standard Operating Procedures that ensure nearly 100% uptime—critical for AI workloads where interruptions would be severely disruptive.

Our operational model leverages bleeding edge technologies along with detailed operational know how built up with decades of experience which is almost impossible to replicate. And this approach represents a virtuous cycle where advanced technology helps us deliver better services for high-performance computing.

Vendor Neutrality: Supporting the Entire AI Ecosystem

One principle we have championed throughout our journey is remaining vendor and technology-neutral. The digital landscape continues to evolve rapidly with multiple hardware architectures, frameworks, and deployment models competing for enterprise adoption.

Our facilities support high-performance computing deployments from all major OEMs and service providers, allowing customers to choose the technology stack that best suits their needs rather than being constrained by infrastructure limitations. This flexibility has proven particularly valuable as organizations experiment with different approaches to building and deploying new-age tech solutions.

Sustainability: The Non-Negotiable Imperative

We have remained equally dedicated to environmental responsibility while aiming for technological excellence. As signatories of NetZero India, we've implemented a comprehensive sustainability strategy that has already achieved a 48% contribution of green energy across our portfolio. Sustainability is a non-negotiable pillar of our growth trajectory targeting carbon neutral operations by the turn of the decade.

Our entire portfolio reflects this approach with onus on energy efficiency, PUE cooling design, water conservation through closed-loop systems, rainwater harvesting, greywater reuse, and low-GWP refrigerants. These initiatives aren't just environmental—they represent sound business

strategies that reduce operating costs while aligning with the sustainability goals of our forward-thinking customers.

We have a comprehensive ESG roadmap in place, strong monitoring and reporting, readiness to adhere to the overall compliance landscape and leading the industry in responsible growth even as we expand to meet unprecedented demand.

Innovation Focus for Future Readiness

Innovation remains at our core for example, Our Pune Data Centre features advanced laboratories dedicated to testing both current and emerging data centre infrastructure technologies. This investment ensures we stay ahead of the curve in supporting next-generation computing requirements.

Our first-ever AI-based patent for data centre operations enhances monitoring capabilities, eliminating gaps, our integrated IBMS provide geography agnostic real time monitoring and interventions. We've built future readiness for scaling with our facilities possessing expansion headroom and secured power and land across major cities in India, ensuring we can scale alongside our customers' growing ambitions.

Looking Ahead: India's AI Opportunity

With our nationwide footprint now spanning 30 AI ready data centres across 10 cities and a total IT load capacity of 390 MW accounting for facilities under construction, we are on track to more than double our capacity in the coming years. STT GDC India stands ready to support the next phase of India's digital transformation that would be driven to a large extent by the overall on AI journey. The infrastructure we've built will enable innovations we can't yet imagine—from breakthrough applications in healthcare diagnostics to financial inclusion tools that extend services to previously underserved communities.

I firmly believe that India has the potential to become a global leader in developing and deploying solutions that address uniquely Indian challenges while creating models that can scale globally. The right infrastructure is critical to realizing this potential, and that's precisely what we've built and continue to build and operate at exacting standards. As we continue expanding our capabilities and reach, our commitment remains steadfast: STT GDC India will continue pioneering the infrastructure that enables Indian enterprises and innovators to harness the full potential of artificial intelligence and emerging technologies, creating lasting value for our economy and society.
