CLIMATE CHANGE HAS significantly disrupted weather patterns, leading to harsher summers, shorter winters, and unpredictable monsoons. These shifts have directly impacted power consumption. The 105-year-old Tata Power recognised the evolving demand patterns early on.

To meet peak power requirements, the company set out to transition from a conventional, coal-based power provider to a leader in green energy solutions.

In 2020, Tata Power became the first Indian company to announce a goal of achieving carbon neutrality by 2050, later revising it to 2045. This meant a halt to new investments in greenfield coal-based power plants and a sharper focus on renewable energy.

“In a distribution company, you need to be on your toes, whether rains arrive in June or July. Based on that you need to supply power 24/7. We need to keep in mind peak power both during the day and night, especially when everyone switches on air conditioners at 45–50-degree temperature,” says
