

complementary to their capabilities can generate multi-dimensional value to gain a competitive edge in the marketplace. A case in point is an FMCG company which is foraying into new businesses, combining its strength in food technology with its hotel business to create cloud kitchens, and using its agriculture business to serve as a backend for its frozen vegetables segment.

To keep up this momentum of creating multidimensional value, businesses could focus on integration at three levels:

Integrate a clear perspective of potential shifts in the industry: In the age of intelligence, the physical resources and value chains that once defined traditional industry boundaries are becoming less distinct. Data now contributes to a company's revenue streams as much as, if not more than, products. Data-driven ecosystems are unlocking new opportunities for cross-industry partnerships and collaboration. This ecosystem collaboration enables traditional industries to look beyond their boundaries and tap into emerging value pools to gain a competitive edge. However, organisations need to maintain their customer-centric perspec-

tive when determining the shareholder value they aim to create. For instance, a CEO might need to identify which ecosystem stakeholders or new industries could also benefit from keeping the company's customers satisfied. Additionally, it is important to consider the potential risks of entering a new industry versus collaborating with existing stakeholders within the industry. In all of this, a clear perspective, leveraging the power of data and analytics rather than intuition, would play a key role.

Integrate sustainable products and services into the company's portfolio: One-third of India CEOs in our CEO survey noted revenue increases from climate friendly investments over the past five years. Moreover, forward-thinking businesses have begun to identify and leverage opportunities arising from climate mitigation and adaptation efforts. A few have already begun offering alternative construction materials, risk modelling tools, climate risk insurance and improved seed varieties. The time is ripe for organisations to consider what climate-friendly products and services they could add to their business portfolio to avail of untapped opportunities.

Integrate GenAI into workflows and processes:

Investments in GenAI in several sectors are still limited and firms often tend to view these as a check in the box. Organisations should commit to methodically integrating GenAI with appropriate governance into workflows and processes to unlock growth and innovation. By leveraging GenAI and now agentic AI, companies can enhance and introduce new offerings as part of their reinvented business models. This technology could also enable shifts in the value chain and channel disintermediation, allowing businesses to manage volumes intelligently without incurring additional costs, resources or overheads.

An innovation ecosystem with an integration at these three levels and strategic partnerships as a pivot, holds the key to business viability, which in turn is intertwined with the creation of multidimensional value. **BT**
