Q: What are the future growth sectors for the company?

A: What is booming are data centres. The data centres being built here are up to 40 megawatts. In the US, we're building data centres up to 1 gigawatt, which is massive. These are coming to India too. This boom will happen for the next five years. We're doubling that business by multiples. This will start becoming the key to the electrification business too. The data centre segment accounts for 15% order intake of the electrification business. It will become the number one revenue segment. I think we will see the same in India, this year or next year. We also see strong growth in integration of renewables with the electricity grid. So, data centre and integration of renewable power into the grid are the two key areas.

Then there are green hydrogen projects. Teams

“I’m impressed with what I’ve seen (in India) on the green side with use of solar and wind and plans to get into small modular nuclear reactors”

in our automation and motion verification business work on application know-how and support Indian customers but we also use that as a global hub for hydrogen know-how. You need electrification, high-
