

GREAT AMBITIONS

- 01 **Mankind Pharma disrupted the market by making medicines significantly cheaper**
- 02 **Starting with general medicines, the company expanded into chronic care, consumer health, and super-specialty segments through acquisitions**
- 03 **Mankind Pharma strengthened its R&D with innovations like dydrogesterone and obesity treatment drugs**
- 04 **While India remains its priority, the company is expanding into Latin America and Europe**

for low-income families to afford it," he says. Juneja then resolved to make medicines more accessible. This commitment also inspired the name 'Mankind Pharma', reinforcing its mission to serve people.

"There was significant resistance, and questions were raised about the drugs' quality. But we remained firm, provided independent test results, and proved our credibility," he says. The strategy worked—Mankind Pharma gained trust among doctors and patients and steadily expanded its reach.

Initially focused on general medicines and painkillers, the company gradually moved into chronic disease segments such as cardiology, diabetes, and psychiatry. By 2002, it had broadened its portfolio. Today, it offers over 500 products across multiple therapeutic areas.

Mankind Pharma launched its IPO in April 2023. The company made its stock market debut on May 9, listing on both the BSE and NSE. On Mankind Pharma's future, Juneja remains ambitious. "If not the market leader, we hope to be among the top two in terms of sales and market capitalisation," he says.

The company pursued both organic and inorganic growth strategies. In October 2024, Mankind Pharma completed the acquisition of Bharat Serums and Vaccines Limited (BSV) for ₹13,768 crore. Earlier, in March 2022, it acquired Panacea Biotec's domestic formulations brands in India and Nepal for ₹1,872 crore.

"We have made two acquisitions in the past three to four years, and we are working on integrating them into our system. Additionally, we are setting up a new manufacturing facility in Vadodara, which should be operational by the end of the year," Juneja adds.

The company currently operates around 30 manufacturing plants and exports to the US. It is also strengthening its research and development ca-

pabilities. "We have a dedicated R&D facility focused on asthma and bronchitis, and we are designing our own drug delivery devices," Juneja says.

While the company has a strong domestic presence, it is also eyeing international growth. "We are working on entering Latin American and European markets, though regulatory approvals take time—sometimes three to four years," he notes. However, he acknowledges the challenges of the European market due to strict regulations and government-controlled pricing.

Mankind Pharma recorded 18% year-on-year (YoY) growth in revenue, reaching ₹10,335 crore in FY24, supported by an increase in modern trade and hospital sales. Profitability improved, with EBITDA rising 33% YoY to ₹2,550 crore and profit after tax (PAT) increasing 48% YoY to ₹1,942 crore. The company maintained a net cash position of ₹3,260 crore, reinforcing its ability to sustain long-term growth and expand its focus on the chronic segment. Ramesh Juneja's son, Chief Operating Officer Arjun Juneja, is focused on taking the company to greater heights.

SLOW AND STEADY

When Mankind Pharma was founded, its mission was clear—make affordable medicines accessible to smaller towns, villages, and Tier III cities where healthcare was scarce. At the time, people in these regions often had to travel to bigger cities for treatment, and most available medicines were unaffordable for many. Recognising this gap, Mankind Pharma stepped in to bridge it.

"We started with limited resources, which meant we had to be strategic and creative in identifying market opportunities," says Arjun Juneja. "By focusing on cost-effective pricing—often significantly lower than competitors—we quickly gained traction
