

these developments for optimised logistics and transportation. Additionally, leveraging Group synergies through Multi-Modal Logistics Parks will enhance distribution networks and reduce logistics costs.

Ways to streamline logistics costs

Adani Cement has implemented strategic initiatives to streamline logistics costs, including the “Go Direct” programme, agile logistics infrastructure, and the “Commercial Excellence” initiative. Shifting from diesel to CNG, liquid natural gas (LNG) and electric transportation has significantly reduced logistics costs and the carbon footprint, boosting sustainability and economic efficiency.

Embracing digital transformation, real-time AI-enabled tracking ensures 98% global positioning system (GPS) coverage, allowing customers to track shipments and receive estimated arrival times, enhancing customer satisfaction. The Cement Network Operating Centre further supports real-time it has implemented advanced logistics and fleet management systems. R demand and supply optimisation, enhancing operational excellence and efficiency.

The company has integrated a modern electronic proof of delivery system to enhance logistical efficiency and transparency. Improving on time, in-full dispatches simplifies delivery confirmations, while the vendor billing portal ensures transparent and quick payments. Real-time tracking provides complete visibility, and the touchless approach streamlines freight bill submission, eliminating physical documents. The business has integrated digital solutions for in-plant automation and advanced tracking, resulting in decreased truck turnaround times and a substantial boost in dispatch capacity.

This system ensures real-time monitoring, adherence to safety protocols, and efficient fleet management by achieving significant cost savings and improving on-time, in-full dispatches.

Safety remains paramount

The company has set up best-in-class Driver Management Centres (DMCs) with dedicated safety professionals at each plant to manage the safety of drivers. These DMCs provide defensive driver training, GPS monitoring, and behaviour-based safety counselling and awareness. It also takes care of the drivers' health through regular check-up campaigns, healthy food, hygienic rest areas, and sanitation facilities at each of the plants.

The establishment of centralised logistics control tower facilitates comprehensive real-time performance monitoring and proactive decision-making. Strategic route planning and the integration of GPS technology has led to significant cost savings and enhanced logistics efficiency. It has added 11 “General Purpose Wagon Investment Scheme” (GPWIS) rakes to reduce the uncertainty in the supply chain for clinker movement. Further, the addition of 62

specialised Bogey Covered Fly Ash/ Cement (BCFC) rakes enables safe and cost-effective sourcing of Fly Ash from thermal power plants to cement plants.

“We meet growing customer demands while minimising our environmental footprint,” said Mr. Vinod Bahety, CEO, Cement Business, Adani Group. “By integrating Industry 4.0, AI, and data analytics, we optimise our supply chain, making us leaders in sustainable cement production. Our efficient supply chain sets industry benchmarks, contributing to the nation’s “Viksit Bharat” vision and ensuring a brighter, more sustainable future for all,”

he added.

Exponential growth

For instance, Ambuja and ACC are continuously working towards a significant 100 km reduction in lead distances by optimising plant and warehouse footprints. Strong merger and acquisition (M&A) activity has increased the total number of Bulk Cement Terminals (BCTs) to 10, enhancing its presence along the coastline of peninsular India.

At present, the company has a total of 12 dedicated bulk cement vessels to transport cement in the most cost-effective and sustainable manner to the BCTs located along the western and eastern coastlines. Furthermore, it will soon be added another 10 new vessels to transport cement and clinkers to all 10 terminals.

Adani Group's cement business is leveraging this enhanced footprint towards sustainable growth with reduced emissions, enabling larger volumes and lowering overall logistics costs. It is widening its coastal and rail footprint and leveraging advanced innovations by leading the way towards a more efficient and sustainable future in logistics.
