2024 Fortis Healthcare received CCI approval to acquire an additional 31.52% stake in Agilus, increasing its total shareholding to 89.2%

for the medical testing companies? The following numbers may provide an answer. The Indian diagnostic industry was valued at ₹1.8 lakh crore in 2024 and estimated to expand at a compound annual growth rate (CAGR) of 10.9% from 2024 to 2030, financial information provider GlobeNewswire wrote in a recent research report. By 2030, the industry's annual revenue is estimated to reach ₹3.5 lakh crore.

By some industry accounts, Tier 1 and Tier II cities were already contributing around 40% of the diagnostic market's revenue by 2024. Revenue has been growing 25% year-on-year in small-town India, outpacing the 10% growth in metropolitan markets that had for many years been the comfort zone of diagnostic firms. As 140 million households move into the middle-income bracket and 20 million into the high-income bracket in the years between 2018 and 2030, spending on services will rise significantly, according to the World Economic Forum (WEF).

According to the WEF, India's healthcare spending is projected to increase three to four times by 2030, driven by a growing middle class. In 2018, India's total consumption expenditure was around \$1.5 trillion. By 2030, this is expected to rise to between \$5.7 trillion and \$6 trillion, including healthcare spending. Growing healthcare awareness, especially after the coronavirus pandemic of 2020, 2021, and 2022 that boosted diagnostic services, an expanding middle class and rising household incomes in the hinterland are contributing to the shift by diagnostic firms.

Home collection of biological samples and digital reports—popular and growing trends that started with the pandemic—have
