

IWC SCHAFFHAUSEN Portugieser Eternal Calendar

Now here's a watch you can will to your fifth generation. The IWC Schaffhausen's Portugieser Eternal Calendar has a perpetual calendar function (showing days, months, and years) that is set to run without any correction for 400 years. Traditional perpetuums need adjustments once a century, but this takes into account the Gregorian calendar's leap year exception rules by skipping three leap years over 400 years. The accompanying moonphase is calculated to accurately replicate the moon's waxing and waning for 45 million years, by which time it will have deviated by just one day—of course, you just have to take IWC's word for it!

JACOB & CO Astro- nomia Regulator

There are watches, and then there is Jacob & Co. This year, the maverick brand has launched the Astronomia Regulator with an all-new calibre that is born from the brand's years of work in the sphere of rotating, vertical, and tourbillon movements. So, under a domed sapphire crystal, you have a carousel featuring several objects revolving around a central axis as well as rotating on their own axis, with each arm bearing a complication. One is a flying tourbillon, making one rotation per minute, and the other two arms are dedicated to the time display. Below all this, the seconds are displayed by a golden hand pointing to a blue ring that bears the seconds scale. It was launched just before Watches & Wonders and is limited to 250 pieces.

PRICE: \$280,000
