

INTELLIGENT DEVICES

The next innovation in devices will be about infusing consumer hardware with artificial intelligence. Here are a few examples

BY NIDHI SINGAL

PURE MAGIC

For its latest flagship, Samsung has collaborated with Google for its AI smarts. Called Galaxy AI, it comes with a host of features. Take Circle to Search, for instance. Irrespective of the app you're in, just long-press the home button and circle an object or word. And voila! It is swiftly overlaid with search results without having to switch apps. Then there's Chat

Assist, a convenient solution for adjusting tone, translating, or spell-checking while texting and composing emails, right from the keyboard. Say, you receive a message in Korean on WhatsApp. Chat Assist prompts you to download the language pack and then translates the message. What's more, it also translates calls in real-time, while the voice recorder can generate transcripts and even a summary in a matter of seconds. Galaxy AI shows its chops in image editing—including removing undesired elements and relocating subjects or objects within the frame.
