Looking ahead 5–10 years, how do you see the GCC staffing landscape evolving in India?

Over the next 5–10 years, we expect the GCC staffing landscape to become even more dynamic and specialised. The number of GCCs in India is projected to rise significantly, with a strong shift towards advanced digital, research and engineering roles and a broader geographic footprint in Tier II and Tier III cities.

There will be greater emphasis on niche skills, digital transformation and flexible work models.

As the ecosystem matures, we anticipate improved margins, new business models and a more integrated approach to talent management, further cementing India's

position as the global hub for GCCs.

How is the company preparing to meet the rising demand from GCCs?

We are proactively adapting our offerings to address the surge in demand from GCCs. As GCCs expand rapidly in India, not only in IT but also in healthcare, BFSI, retail, and logistics amongst others, we are focusing on building specialised talent pools and enhancing our recruitment capabilities for both traditional and niche skills such as AI, ML, cybersecurity and data analytics.

We are investing in upskilling and targeted sourcing to bridge the gap in emerging technology domains. **BT**

cities housed about 7% of the total GCCs in FY24, up from 5% in FY19.

Experts say in the post-Covid world, with the right digital infrastructure and reliable power supply, Tier II and Tier III cities can become viable hubs for business operations. "We're already seeing this shift. As connectivity and infrastructure improve, the smaller cities are increasingly poised to attract GCCs. This trend will gain momentum in the years ahead, enabling broader geographic diversification and tapping into talent pools beyond the metros," says Pan-kaj Vyas, CEO and Managing Director, of Siemens Technology and Services.

FROM BACK OFFICE TO BOARDROOM

GCCs in India have evolved from providing basic data entry and IT support into hubs driving global decision-making for boardrooms across sectors. "The ecosystem is rapidly maturing as over 53% of GCCs have evolved into portfolio and transformation hubs. Leadership density is on the rise, with more than 6,500 global roles now based in India. These include more than 1,100 women in senior global positions," says Srinivasan.

With an annualised growth rate of more than 10% over the past six years, GCCs' market size in India stood at \$72 billion at the beginning of 2025, compared to \$40.4 billion in FY19. The market size of GCCs is projected to reach \$110 billion by 2030 with more than 2,400 GCCs in the country, as per Talent 500.

"We have shifted from a traditional "say-do" model—where the headquarters dictated and we executed—to a model where we define our deliverables and follow through. That shift from cost to value, and from volume to value-driven growth, marks a significant transformation in the role and contribution of India's GCCs," says Vyas.

Srinivasan says India has become a microcosm of global organisations. Every business unit has some representation in
