“At this point, where de-globalisation is creating uncertainty about global trade, India’s core strategy must be to build resilience”

ARUN SINGH
GLOBAL CHIEF ECONOMIST,
DUN & BRADSTREET

on-year (YoY) to \$24.14 billion in FY25 from \$15.57 billion in FY24, making it the country’s top exported good last fiscal. Overall, India’s electronics goods exports surged 37% YoY to \$38.6 billion in FY25, while exports of engineering goods rose by 9.5% YoY to \$116.7 billion in FY25. Similarly, drugs and pharmaceutical exports rose 9.3% YoY to \$30.5 billion last fiscal.

India’s semiconductor industry is also on the cusp of a breakthrough and Union Minister Ashwini Vaishnaw recently announced that India’s first homegrown semiconductor chip of 28-90 nm is expected to be launched later this year.

Singh of Dun & Bradstreet notes that the PLI scheme is showing tangible results in manufacturing, especially electronics, with the country turning a net exporter of smartphones. “The momentum has been strengthened with a fresh \$2.7 billion al-

location announced in March for electronic components, alongside growing foreign investments by firms like PSMC and Foxconn—key steps in India’s semiconductor self-reliance strategy,” he says.

Mahajan also believes that the combination of measures undertaken till now has helped India. “We are now in a situation where we are manufacturing semiconductors. Our chemicals and API industry is bouncing back, defence is doing well and we are even manufacturing electronic goods, albeit with foreign help. A lot of innovation is coming back,” he says.

A recent report by Bain & Company in collaboration with IT industry association Nasscom has outlined a technology road map to position India as a high-income, developed economy by 2047 with a projected GDP of \$23–35 trillion.

“India will potentially need to make a critical shift, transitioning from a net importer to a globally competitive, export-driven economy, particularly in high-impact sectors such as electronics, chemicals and energy,” says the report, titled *India @2047: Transforming India into a Tech-Driven Economy*.

Elsewhere, India has turned its attention to critical and rare earth minerals, which have also got engulfed in geopolitical tensions. India has launched a National Critical Mineral Mission (NCMM) to lower its dependence on China, a dominant player in the sector. The recent curbs by China highlight the need for this.

Experts underline that India’s long-term growth priorities rely on building resilience in these areas. A recent report by EY India says that further support from both public and private sectors will be important in this area, adding that strengthening partnerships with countries rich in rare earth elements could also help reduce risks.

The road to self-reliance also depends on building new export markets. India aims to account for 10% of global exports by 2047.
