

will increase Mumbai's capacity to import an additional 1,000 MW of power. In 2023, Adani Energy Solutions commissioned the Kharghar-Vikhroli transmission project, securing 1,000 MW of additional power for Mumbai city. Together, these two projects will enable AEML to increase the procurement of green power.

Sustainability holds the key

AEML is not only meeting the city's current power demands but also paving the way for a sustainable and resilient energy future. By leveraging technologies like the Advanced Distribution Management System (ADMS), the company has not only set a benchmark for power supply management in the country but also positioned itself as a critical player for Mumbai's urban infrastructure. ADMS can prevent outages, address disruption, and optimise the supply network's performance. For a densely populated megacity like Mumbai that depends on uninterrupted power supply, it is set to become a gamechanger.

As one of India's largest and most dynamic cities, Mumbai's infrastructure needs are both complex and critical. Through strategic investments in renewable energy, infrastructure, and technology, Adani Electricity Mumbai Limited is paving the way for a sustainable and resilient energy future.

strengthening and expanding Mumbai's power infrastructure to keep it future ready. With a planned investment of around Rs 1,600 crore in FY26, which includes laying new, and upgrading existing transmission lines and substations, and integrating advanced technologies, the company is fully committed to provide uninterrupted power supply, despite ever increasing demand. AEML boasts of a supply reliability of 99.99%, indicating less than 53 minutes of downtime in a year, which is amongst the best nationally and even internationally.

"When I shifted to Mumbai from Kanpur a few years ago, I moved with my inverter and stabilisers (for protection of electrical equipment like AC and TV). They are completely redundant here as there is neither power cut nor voltage variation," said Sudha Jaiswal, a homemaker and a proud Mumbai resident.

Through increased use of advanced technology and vigilance, AEML has been able to bring down distribution losses. In FY25, the company's distribution loss stood at 4.77%, as compared to 5.29% in FY24. The national average for FY24 was 12.4%, as per Niti Aayog data.

The distribution loss is ultimately recovered from paying customers by way of higher tariffs. Lower distribution losses can lead to lower tariffs and improved services. By reducing waste and improving efficiency, distribution companies (DISCOMs) recover more revenue, which can be used to lower tariffs or reinvest in infrastructure, thereby improving reliability and customer service.

Adani Electricity has been ranked India's top DISCOM thrice in a row in a study conducted by the Union Power Ministry.

AEML Grid Watch

- Estimated power requirement by 2030: 6,000 MW.
- Planned investment in FY26: Rs 1,600 crore.
- Supply reliability: 99.99% (less than 53 minutes of downtime in a year).
- Distribution loss: 4.77% in FY25 as compared to 5.29% in FY24.
- Upcoming project: Transmission line between Aaray and Kudus; will increase Mumbai's capacity by an additional 1,000 MW.

The study included key metrics such as reliability and billing efficiency.

To strengthen the power grid and expand the network in Mumbai, Adani Electricity is constructing a transmission line between Aarey and Kudus. Once operational, this
