

SUSTAINABLE PRACTICES Chandon India has set up 734 solar panels

DRINK RESPONSIBLY

▶ Since 2020, Diageo India has reduced water use by 54% in distillation processes and 35% in packaging operations

▶ At present, 59% of Diageo India's packaging material is made from recycled content; it has eliminated mono-cartons from 95% of its portfolio

▶ Pernod Ricard India is moving from rice-based Grain Neutral Spirit to maize, which has one-third the carbon footprint of rice

▶ Pernod Ricard India is reusing 20% of its bottles

▶ Chandon India has set up 734 solar panels covering 3,000 sq mt of the property through which 60% of the vineyards' power needs are met

▶ 80% glass used by Chandon India is green. Less CO₂ is emitted during the production of green glass

tons. "By eliminating permanent mono-cartons, we have reduced CO₂ emissions by 10,000 tonnes," says Sethi. From the baseline year of 2018, the company is planning a 25% reduction in water consumption by 2030.

LVMH Moët Hennessy Louis Vuitton SE, or LVMH, which owns Moët Hennessy's sparkling wine brand Chandon, is also becoming more sustainable by reducing water consumption and reimagining the use of glass to reduce the carbon footprint.

Chandon is produced in six regions, including India. "It operates with the same consideration and sustainability commitments as all our five sister wineries across our 1,400 hectares of primary vineyards across the globe. We call our mission Lands of Diversity," says Rajesh Dixit, Winery Director, Chandon India, Moët Hennessy India.

Chandon India's objectives are in line with LVMH's commitment to halve CO₂ emissions (Scope 1,2,3) by 2030. As glass is the main contributor to its carbon footprint, half the bottles weigh 775 gm or less compared with the standard 835 gm. About 80% of the glass used by the company is green—producing green glass emits less CO₂. The company also plans to remove all plastic from packaging by 2026. It is investing significantly in generating green electricity and has set up 734 solar panels covering 3000 sq. mt. of the property through which 60% of the vineyards' power needs are met, saving an estimated 386 tonnes CO₂ emissions every year.

With the climate clock ticking fast, the alcobev companies need to do their part. **BT**
