

supply chains for operational continuity. “India is confronted with a pressing energy trilemma—availability of affordable, sustainable and self-sufficient energy. This trilemma will become more acute as India’s economy becomes larger and grows faster. In 2023, India generated nearly 1,600 billion units of electricity. To meet growth projections, this number needs to double in the next 10 years. Obviously, green and clean energy will need to provide the lion’s share of this growth,” RIL Chairman Mukesh Ambani said at the company’s 2024 annual general meeting.

RIL is advancing the clean energy transition by undertaking major developments at the Dhirubhai Ambani Green Energy Giga Complex in Jamnagar with the construction of a fully integrated new energy ecosystem. This includes polysilicon to solar PV module manufacturing with 10 GW per annum capacity, integrated advanced chemistry-based battery manufacturing with 30 GWh initial capacity, renewable energy on round-the-clock basis, fully integrated green hydrogen to green chemicals multi-GW electrolyser manufacturing and 55 integrated compressed biogas plants by 2025.

Every company is devising its own strategy to hedge against climate risk. Take the Aditya Birla Group (ABG), which has a consolidated market cap of over \$100 billion and is present in cement, mining, carbon, financial services, fashion & retail, and textiles. Given this diversity, the group has, over time, evolved its initial site-based manufacturing-oriented approach into what it calls Sustainability 3.0. This allows it to contextualise for the diversity in sectors, geographies and maturity level of different businesses. Now, digital technology and innovation are playing a bigger role in driving the agenda.

“We implemented the sustainable business framework with Sustainability 1.0, while 2.0 put quantitative performance targets in place. As we move to 3.0, we have deployed more digital tools. We’ve worked closely with our in-house data analytics team and now have an ESG

NET-ZERO COMMITMENTS: GLOBAL STATUS CHECK

- Few Indian companies have science-based emission reduction targets
- Polluting industries need to step up their efforts

data lake. The platform is being implemented to strengthen and streamline sustainability efforts across the organisation by enhancing data integration, monitoring and reporting capabilities,” Deeksha Vats, Group Chief Sustainability Officer, Aditya Birla Group, tells *Business Today*. Vats says all group companies are working on their own transition to sustainable pathways based on their sector’s uniqueness, geography and value chain approach to include key stakeholder expectations, and short- and long-term time horizons.

The Tata group’s sustainability policy articulates how companies can create long-term stakeholder value by integrating economic, environmental and social considerations. The aim is to help all group companies integrate sustainability considerations into all decisions and key work processes, mitigating future risks and maximising opportunities.

Since the start of Project Aalingana, all companies in the group have taken steps towards low-carbon transition. Tata Power, one of the country’s largest power players, is focusing on making its generation portfolio 100% clean and green by 2045. “The company’s decarbonisation journey follows a clear path to scale up renewables while ensuring the resilience of the system. At present, 44% of our generation comes from clean and green sources. By 2030, we aim to reach 70%, with a goal of 100% clean and green energy portfolio by 2045,” Tata Power CEO & MD Praveer Sinha tells *BT*. He says plans for continued expansion of so-
