

Government of
Madhya Pradesh

Luminous Performance in the Power Sector

At the time the present government took over the state was in a state that could only be called *satis*, with almost every sector crying for development that had eluded them over the years due, mainly, to the gross neglect of infrastructure. Lack of proper infrastructure to facilitate all round development has, indeed, been the Achilles' heel of this heartland state of the country. From day one the government pitched into making a dent in the inertia by de-clogging the development machinery at every level while mobilizing resources to achieve the development goals. It gave a fresh impetus to development of infrastructure with particular emphasis on roads, electricity and water while, at the same time, attaching equal importance to social sector.

Lighting the way to prosperity

Availability or the lack of power directly impacts the development of any state, society or country. Among the energy options available, power indeed plays the most crucial role. It not only drives the industrial output but also affects the prospects of industrial investment in the state. On the mass consumption front, too, the availability impacts our lives in more ways than one. It directly affects the quality of life, the agricultural output and even drives the demand for consumer goods. To put it simply it is the most important drives for economic growth today.

The present state government inherited a deep power crisis with entire state literally plunged into

darkness. Given the crucial role that power plays in the development, the government naturally placed the availability of adequate power to the people on top of its agenda. Action was initiated in earnest to augment both the generation and distribution infrastructure in the state. For the first time since its inception Madhya Pradesh would be adding over three thousand MW to its power generation by end of the year. Of this, generation of 2400 MW has already started. This is in stark contrast to a mere 3000 MW capacity developed in the state in 56 years since independence. Earlier the

highest capacity generating unit of the State sector was 210 MW. Recently, highest capacity thermal unit of 500 MW commissioned in Birsinghpur in June 2007.

Madhya Pradesh has some very important achievements to its credit in power sector. In last two years uninterrupted power supply has been made to industry and round-the-clock supply to all the consumers from the month of July. During last three years the power generation capacity has been enhanced by 2396.5 MW. Plans have been put in motion to harness all possible sources for power generation. The ideal ratio of thermal and hydel generating capacity has been achieved in the State, which is now 60: 40. The 1000 MW capacity Indira Sagar Hydel Power Project has gone into production. Share of 826.5 MW has been received from Sardar Sarovar Hydel Power Project. Besides, generation of 20 MW from Bansagar, 40 MW from Madikheda and 10 MW from left bank canal of Bargi has been started. Recently, a 500-MW new unit of Birsinghpur power state has been synchronized. This Rs. 2300 crore project would generate 3723 million units annually on completion. In order to encourage power generation through Non-conventional Energy Sources, the State has notified an incentive policy on in the last quarter of year 2006.
