

SCIENCE OF AGEING

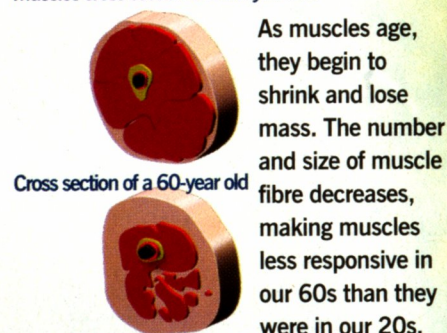

All that you ever needed to know about growing old and how to delay it

SKIN

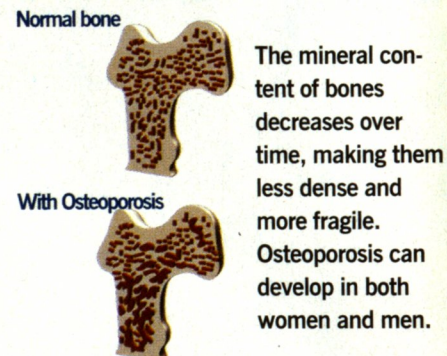

MUSCLES

Muscles cross section of a 20-year old

BONES

AGE AT WHICH SENSES MAY CHANGE

At 40 years

VISION AND TASTE
Visual acuity begins to decline. Number of taste buds decreases.

At 50 years

HEARING
The sharpness of hearing may decline slightly beginning at this age.

At 60 years

SMELL
The olfactory senses diminish as one approaches the age of 60-70.

HEART: Becomes less able to pump blood quickly. We tend to get tired more easily.

NERVE CELLS:
Decrease in number, which may cause the spinal cord to atrophy.

STOMACH: Produces less acid after 50, which makes it difficult to absorb Vitamin B12.

JOINTS: Motion of joints becomes restricted. Result: flexibility declines.

HANDGRIP:
Strength goes down, making routine tasks difficult.

CARTILAGE:
Begins to break down, leading to arthritis.

HEIGHT:
Progressively decreases. After the age of 40, the average height loss is about 0.4 inches every 10 years.

HELPING YOUR BODY COPE WITH THE CHANGES

MENTAL ACUITY: B vitamins and physical activity cut the risk of Alzheimer's.

VISION: Vitamin C, E and beta carotene with zinc may help cut degeneration in those at high risk of eye diseases.

BONES: Peak bone mass occurs at the age of 35. Walking, jogging, weight training can preserve bones.

MUSCLES: Weight training exercises may help slow age-related muscle loss.

STOMACH: Eat fibre. Women should eat 25 g daily, men 38 g.

BLOOD: Vitamin B12-fortified foods prevent anaemia, heart and nerve problems after 50.

HEART: At least 30 minutes of brisk physical activity daily. Eat more fibre-rich foods such as oatmeal to help reduce blood cholesterol. Limit sodium to keep blood-pressure under check. Skip trans fats.
