

The world's largest wind-solar hybrid cluster of 2,140 MW is in Jaisalmer, Rajasthan.

ANIL is India's leading vertically integrated solar manufacturer developing a 10 GW integrated ecosystem at Mundra, Gujarat.

sector—the world's largest and India's first wind-solar hybrid power cluster of 2,140 MW in Jaisalmer, Rajasthan and one of the world's largest single location solar power project of 648 MW at Kamuthi, Tamil Nadu. Globally, it ranks amongst the top 10 renewable energy independent power producers (IPPs) and is ranked as the world's second largest solar PV plant developer by Mercom.

The company's growth is also attracting global capital. AGEL has consistently raised sustainability-linked financing from global investors. With ESG (environmental, social and governance) capital flows reshaping investment worldwide, AGEL demonstrates how an emerging market company can tap global liquidity pools to fund the green transition.

India's Global Role in the Renewable Supply Chain

India's rise as a clean energy hub is not only about generation but also about manufacturing and supply chains. With 100 GW of module capacity in 2025—and a target of 190 GW by 2027—India is already among the world's top five largest solar manufacturing base. Adani Solar, part of the Group's integrated value chain, is spearheading this expansion, producing high-efficiency modules and solar cells that meet both domestic demand and global exports. The company has pioneered in India ingot/wafer and TOPC on cell technology while driving vertical integration, supply chain optimisation, and technological innovation.

This is critical as global economies look for supply chain diversification by combining scale in generation with strength

in manufacturing, the Adani Group is steering India's clean energy transition and making India the global renewable energy manufacturing hub.

Financing the Transition

The green transition is capital intensive, and the Adani Group has become a magnet for global green finance. The company has raised billions of dollars through green bonds, sustainability-linked loans, and ESG-driven investment platforms. With diversified capital pools to meet its financing needs including domestic banks and financial institutions, international banks as well as global and domestic bond markets, AGEL is maintaining fully funded growth and is well-positioned for sustained growth.

These instruments not only lower capital costs but also deepen global investor confidence in India's renewable sector. With institutional investors and sovereign funds increasingly tying capital to ESG benchmarks, AGEL is setting precedents for how emerging-market firms can secure long-term financing at competitive terms.

Why Adani Group Matters for the World

AGEL's growth is more than a corporate success story—it represents a template for how developing economies can lead the clean energy revolution. By executing projects at unprecedented speed and scale, AGEL is demonstrating that the pathway to net-zero is not the preserve of developed nations. The company's Khavda ultra large-scale renewable plant, has the potential to reduce annual CO₂ emissions by over 63 million tonnes once fully operational. For global climate targets, this is equivalent to taking over 13 million cars off the roads each year.

The Road Ahead

As the world races toward 2030 climate deadlines, India's ability to scale renewable power will determine the pace of the global transition. With Adani leading the charge, India is not just participating in the energy transition—it is helping to define it.

From desert landscapes in Gujarat to global capital markets in New York and Singapore, Adani's trajectory both in renewable energy generation and boosting domestic manufacturing reflects the convergence of ambition, execution, and finance. In doing so, it is helping shape a future where affordable, reliable,

Building India's Renewable Powerhouse

Since embarking on its clean-energy pivot in 2015, the Adani Group has established itself as the undisputed frontrunner of India's renewable energy transition. Today, AGEL is the nation's largest producer of renewable power, with a portfolio spanning solar, wind and hybrid assets that continues to expand at a pace unmatched in the industry. Adani Solar has rapidly emerged as India's leading vertically integrated solar company, offering a wide range of products and services across the photovoltaics spectrum.

Crucially, Adani's green growth story is not just about scale—it is about financial and operational resilience. The refinancing of a \$1.06 billion maiden construction facility for the world's largest solar-wind hybrid cluster in Rajasthan reflects the Group's ability to structure long-term, sustainable capital, instilling confidence in both domestic and global markets. While many Indian corporate houses are still grappling with financing constraints and sluggish project execution, the diversified conglomerate has built a model of consistency and credibility.

Global partnerships and endorsements strengthen this leadership. AGEL strengthened its strategic partnership with TotalEnergies by forming a new joint venture for a 1.15 GW renewable portfolio, resulting in an inflow of USD 444 million. Further, Adani Solar is recognised as the only Tier 1 supplier from India by BloombergNEF (BNEF) and is the only solar manufacturer from India, to be awarded as Top Performer by PVEL (PV Evolution Labs) for seven consecutive years.

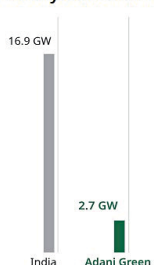

Adani Solar ranked in the top 10 global solar PV module manufacturers by Wood Mackenzie the international energy research firm. It is the only Indian company to be featured in the prestigious list.

These are ringing testament of the Adani Group's execution capability and international stature.

What truly sets the Group apart is its vision for the future. Investments in pumped hydro, battery storage and a 5,000 MW hydropower Memorandum of Understanding (MoU) with Bhutan demonstrate an integrated, forward-looking approach to clean energy innovation.

With strategic clarity, bold execution and unmatched investors' confidence, the infrastructure major is not only leading India's renewable revolution but also leaving others racing to catch up.
