

The EV Ecosystem Pioneer: How Rohit Pandit is Building India's Complete Electric Mobility Solution

From sporting glory to sustainability strategy, this leader is driving India's most ambitious green transformation with unmatched clarity and purpose.

In a nation racing toward electric mobility, most entrepreneurs focus on single solutions—either charging infrastructure or vehicle manufacturing, Rohit Pandit is different. The Managing Director of People's Group and founder of the Klick ecosystem is building something unprecedented: a complete end-to-end electric vehicle solution that could reshape India's transportation landscape.

Pandit's journey from national-level cricket to sustainable mobility reads like a masterclass in strategic pivoting. After earning his CFA designation and cutting his teeth as an equity research analyst in the UK, he transformed People's Group into Central India's most diversified conglomerate. Under his leadership since 2020, the group now spans education (7,000 students across 16 institutions), healthcare (1,600 beds serving 3,500 daily patients), media, and manufacturing.

But it's his latest venture that's capturing national attention. Through Klickwatt and Klickgo Mobility, Pandit is executing what industry experts call the "MakeOperate-Power" model—a vertically integrated approach that addresses India's most pressing EV challenges simultaneously. The numbers tell the story. With fewer than 40 chargers, Klickwatt commands an impressive 20 million annual unit consumption, outperforming industry benchmarks. The company has already established smart charging depots in Mira Bhayandar and Ulhasnagar for Maharashtra's e-bus fleet, while developing large-scale hubs for Ultratech Cement's logistics operations across Dhar, Dhule, and Julwaniya. Klickgo Mobility, launched in 2024, represents the manufacturing piece of this puzzle. The company plans to deploy 10,000 e-buses and e-trucks nationwide, addressing India's critical supply-demand imbalance where commercial EV demand outstrips supply at a ratio of 5:1. "Most players focus on either infrastructure or vehicles," Pandit explains. "We're building both, optimized to work together."

The real game-changer is the solar integration. Pandit's vision includes a 1-gigawatt solar park powering the entire ecosystem, making it completely energy-independent. This approach promises to slash fleet operating costs by 40-50% compared to diesel vehicles while preventing 1.35 million tons of CO₂ emissions annually by 2030.

The economic impact extends beyond environmental benefits. Local manufacturing will reduce vehicle costs by 20-25%, making EVs accessible to MSMEs. The initiative is projected to create 50,000 green jobs and save India \$5-7 billion annually in reduced oil imports. Industry watchers see Pandit's model as potentially transformative. Unlike competitors dependent on foreign suppliers, his integrated approach aligns with Atmanirbhar Bharat while positioning India as a global EV export hub.

As India accelerates toward its 2070 Net Zero target, Pandit's comprehensive ecosystem offers a blueprint for sustainable mobility at scale. He's not just participating in the green revolution—he's architecting it from the ground up.
