

Moreover, ATGL, through its subsidiaries, collaborates with end users, including large corporations and industries, to develop bespoke solutions for decarbonising their operations. A recent and notable example is ATGL's Memorandum of Understanding (MoU) with Flipkart to decarbonise primary, secondary, and tertiary logistics movements.

Focus on global energy market and energy transition

The world is currently navigating through a pivotal decade of energy transition. For India, this transition encompasses not only the adoption of solar and wind energy but also the substitution of primary fuels such as coal, pet-coke, and diesel with cleaner alternatives like natural gas and compressed biogas. Presently, India relies heavily on coal and crude oil products, which constitute over 82% of its energy mix and are significant contributors to air pollution and greenhouse gas (GHG) emissions. A just energy transition can be realised only if the decarbonisation pathways adopted can achieve substantial emission reductions without unduly burdening the economy.

For instance, replacing coal or pet-coke with natural gas in industrial applications can result in over 50% reduction in CO₂ emissions. Similarly, substituting diesel with compressed natural gas (CNG) or liquefied natural gas (LNG) in transportation can reduce CO₂ emissions by nearly 30%, or even up to 100% in the case of renewable compressed biogas (CBG). Additionally, natural gas burns much cleaner than these alternative fuels, producing significantly lower particulate matter (PM) and nitrogen

oxides (NO_x) emissions, while completely eliminating sulfur oxides (SO_x) emissions. For Micro, Small, and Medium Enterprises (MSMEs), large industries, and heavy transportation sectors, transitioning from traditional fuels to renewable energy-derived electricity or green hydrogen is currently uneconomical or technologically unfeasible. In such scenarios, natural gas serves as an ideal transitional fuel until zero-emission technologies become mature.

With the expansion and availability of the CNG network across the country, there has been significant adoption and conversion to CNG as a fuel in the transportation sector, which reduces emissions. Moreover, with the increased adoption of solar and wind energy, the electricity supply for electric vehicles

will contribute further to emissions reduction.

Growth with Sustainability

ATGL is committed to achieving the highest standards in ESG and sustainability. The company has set ambitious targets in several key areas, including renewable energy sourcing, water conservation, fleet decarbonization, waste management, energy conservation, and emission reduction. Additionally, ATGL focuses on creating sustainable buildings and offices, developing a low-carbon society through Greenmoshere—which encompasses mass plantation and sustainability education for millennials—and continuously improving its occupational health and safety culture. The company is also dedicated to strengthening its policies and governance structure to support these initiatives.
