

# ADANI ENERGY SOLUTIONS LEADS THE CHARGE IN SMART METERING IN INDIA

**India's power sector has seen substantial changes in recent years, with the adoption of prepaid smart meters standing out as a game changing technology. The Indian government's ambitious Smart Meter National Programme (SMNP) aims to revolutionise the country's energy landscape by advancing smart metering technology. With a goal to replace 25 crore conventional meters with smart meters nationwide, this initiative offers significant advantages for both consumers and utility companies.**

**A**dani Energy Solutions Ltd. (AESL) is making remarkable strides in the smart metering sector in India. By adopting a holistic and integrated strategy, AESL is set to maintain full oversight of the deployment process and the user experience, ushering in a considerable transformation within the utility industry.

## **What are Smart Meters**

Smart meters are an essential infrastructure upgrade that has heralded a new era in energy management and consumption. The government has mandated the transition to a complete smart metering system for all 25 crore premises, of which less than half has

been bid out, with the rest likely to come up in phases over the next 2-3 years.

Smart meters enable two-way communication between the discom and individual electricity meters, enhancing energy efficiency, improving billing accuracy, and empowering consumers with access to real-time consumption data.

These meters offer a level of granularity and transparency in energy usage, allowing consumers to access detailed information about their energy consumption patterns through user-friendly apps and online portals. This real-time data empowers consumers to make informed decisions about their energy use, potentially reducing their

energy bills and promoting energy-saving behaviors.

For utility providers, smart meters enable better demand forecasting and load management, which are crucial for efficient energy distribution. By analyzing real-time data, discoms can identify peak usage times and flatten the demand curve by offering time-of-day tariffs. Consumers who are more aware of their energy consumption are likely to adopt energy-saving practices, which collectively can lead to substantial reductions in energy demand.

Energy experts say that the mass adoption of smart meters can reduce transmission and distribution losses to low single digits
