Expected  
annual therapy cost  
per patient in the  
long term

tional Research at Systematix Group, estimates that the annual cost of GLP-1 therapy per patient is likely to eventually settle around ₹25,000, down from the ₹1 lakh branded therapies now cost.

“At the peak, we could see a few million patients in India on GLP-1 therapies, but uptake will be shaped as much by convenience and compliance as by price,” says Manchanda.

## BLOCKBUSTERS

To be sure, the first generation of GLP-1 drugs scaled apace globally. Ozempic was first approved in December 2017 and went on to become one of the most widely pre-scribed injectable therapies, laying the foundation for Semaglutide’s expansion into obesity care.

Wegovy, a higher-dose formula-tion of Semaglutide designed specifically for chronic weight management, followed in June

2021. Lilly’s Mounjaro entered the market in May 2022.

The commercial impact was swift. Novo Nordisk’s Semaglutide franchise, spanning Ozempic, Wegovy and oral formulations, generated over \$20 billion in global sales in 2024. Lilly’s tirzepatide, marketed as Mounjaro for diabetes and Zepbound for obesity, crossed \$10 billion in global sales within two years of launch, making it one of the fastest build-ups seen for a chronic therapy.

In India, the market is newer, but moving fast. According to Grand View Research, the India GLP-1 receptor market, which includes drugs such as Semaglutide and Tirzepatide, is estimated to have generated revenue of around \$117.5 million in 2025 (₹970–1,000 crore), highlighting early but growing adoption. Of course, out-of-pocket costs are high and patient persistence is limited.

Mounjaro was launched in March 2025 in India for Type 2 diabetes and obesity and has seen strong uptake, with cumulative sales estimated at around ₹600 crore within months of launch, driven largely by early adopters. Wegovy entered the Indian market in June 2025 at a premium price point, resulting in slower initial volumes.

Pricing has begun to adjust. As competition intensified, Novo Nordisk cut Wegovy’s price in India by roughly one-third, reducing the monthly cost of higher doses from the ₹24,000 range to closer to ₹16,000, and lowering starter doses to ₹10,000–11,000.

The price correction reflects growing pressure on innovator brands to defend market share as affordability and the need for long-term patient persistence draw greater attention.

That pressure is expected to
