Most Wanted Concepts

The recent Mobile World Congress in Barcelona turned out to be the mecca of concepts. Here are our picks

BY NIDHI SINGAL

Future Peek

Over the years, we have had transparent keyboards, TVs, and even phones. But nothing quite prepares you for a transparent display on a laptop. Lenovo's latest concept sports a 17.3-inch MicroLED transparent screen with 1,000 nits of brightness and a transparent keyboard area. The transparent display helps integrate Artificial Intelligence Generated Content, that allows users to interact with physical objects while overlaying digital information. What's more, the transparency of the display can facilitate transitions between the keyboard and the drawing board, with a dedicated pen.

WELLNESS METER

The concept of a smart ring is not new, but Samsung is venturing into this space for the first time with this health-focussed wearable. The Galaxy Ring will simplify keeping a check on your daily wellness, especially when used in conjunction with the digital wellness platform, Samsung Health. The ring can track essential metrics like heart rate and sleep, while the Vitality Score feature offers personalised health insights derived from factors such as sleep quality, activity levels, heart rate, and heart rate variability. Additionally, the Booster Card functionality aids users in achieving healthier daily routines by tracking predefined goals and delivering actionable insights.
