

Wrist Wrapper

Foldable phones are cool. But wouldn't it be cooler if you could slap your phone on to your wrist before heading out? That's what Motorola showed off at this year's MWC. This bendable can be slapped on to your wrist, provided you wear a magnetic band to keep it in place. This concept sports a 6.9-inch screen, a flexible back made of woven fabric, and a user interface that aligns to that part of the screen you're most likely to use. Plus, it comes with MotoAI for a personalised experience powered by artificial intelligence.

ROLLABLE CONCEPT PHONE BY MOTOROLA

This concept phone can double up as your outsized smartwatch and can be bent into any shape

AI FOR THE EYES

OPPO's latest prototype, the Air Glass 3, brings Generative AI to AR glasses, via a connected smartphone app. Activating the AI voice assistant, powered by OPPO's AndesGPT model, is as simple as lightly tapping on the temple of the glasses. The device supports touch interaction, allowing users to easily control functions

such as music playback, voice calls, information display, colour image browsing, and more. Weighing just 50 gm, the Air Glass 3 has a peak eye brightness surpassing 1,000 nits and provides a close-to-normal wearing experience while delivering the most exceptional full-colour display in its class.
