

POWERING THE FUTURE

Adani Electricity's Advanced Distribution Management System redefines energy distribution & grid resilience

Mumbai, India's financial capital and one of the most densely populated cities in the world, has seen a surge in its energy needs over the past few years. The city's bustling commercial and residential sectors, along with multiple infrastructure projects, have placed substantial pressure on its power grids.

The growing demand, coupled with the need for developing a reliable and resilient power supply framework, highlights the importance of ensuring an efficient distribution management system. For this, infrastructure upgrade is as critical as adopting advanced technologies to provide uninterrupted power supply to the city's population.

In a significant step towards modernising Mumbai's electricity supply framework, Adani Electricity has launched India's first Advanced Distribution Management System (ADMS) at its state-of-the-art Network Operations Centre (NOC). This development not only sets a new benchmark for power supply management in the country but is also a critical facility for Mumbai's urban infrastructure.

The ADMS integrates cutting-edge technology to ensure seamless and sustainable power supply to over 31.5 lakh households and establishments across Mum-

bai city. By leveraging real-time data analytics and the latest Supervisory Control and Data Acquisition (SCADA) system, ADMS can prevent outages, address disruption, and optimise the supply network's performance.

For a megacity like Mumbai that depends on uninterrupted electricity supply, this proactive approach to power management is set to become a gamechanger. The ADMS is a comprehensive software platform designed to manage and optimise the operation of electrical distribution networks. It comes with multiple

advantages like real-time monitoring capabilities for continuous tracking of network conditions, and voltage levels. It enables rapid identification and resolution of outages through advanced analytics and automated systems.

The NOC, now powered by ADMS, is at the heart of this technological revolution. It marks a significant development towards achieving a reliable power supply chain -- one that can adapt to the dynamic demands of a growing city like Mumbai. The system's ability to
