

it with extremely hot air. This process consumes a lot of energy and takes a very long time. A great point for optimization.

The spray dryer also gives you a huge amount of data. We used this data to create a digital twin of the spray dryer. The digital twin is physics-based and duplicates the drying process under the exact same conditions as it would happen in the real world – but it saves time and resources that real-world testing would waste.

As a result, the new solution reduced energy consumption by around 10% and increased throughput of the powder by around 10%. This solution is part of our Industrial Operations X portfolio. Thanks to its open architecture customers across various industries can adapt the technology to improve other processes as well.

Another powerful example is of making buildings more sustainable with Siemens Building X. A popular public school in North India found a simple out-of-the-box solution to become

crucial to centrally manage energy loads at any time.

Why do you think Industrial Metaverse will be a game changer?

Because the Industrial Metaverse combines several powerful technology forces like digital twins, edge computing and generative AI, that we need to tackle the challenges we are facing today. It is a place in the digital world where people and machines connect to solve real world problems. It enables us to work together on the same project in real-time no matter whether we are in Mumbai or in Erlangen in Germany. And the Industrial Metaverse is not just an idea. It is already coming to life and delivers real-world impact. In Germany, we are building a whole city district in Berlin in the Industrial Metaverse and in the rail industry it can help us find the ideal place for a static frequency converter and simulate its usage in the digital world before actually constructing it.

As you can tell, at some point, you must get started, and then really speed up through the deployment of each technology to make this work. It will happen step-by-step.

Siemens Xcelerator is a digital business platform that accelerates the digital and sustainability transformations of businesses. It provides a comprehensive, curated portfolio that includes digital and IoT-enabled offerings from Siemens and certified partners, a continuously growing, powerful ecosystem of partners and an evolving marketplace, enabling education, exchange and transaction with a community of customers, partners and experts.

and Beverage Industry is under immense pressure to deliver to their customers amid rising costs, high quality demands and sustainability targets. My Siemens colleagues in India have developed one solution that tackles all these challenges in the industry. It helps companies to stay competitive.

One of the pain points for food and beverage companies worldwide is the production of milk powder. Liquid milk becomes dry powder by spraying

more efficient with maintenance and energy prices. It is a software-as-a-service (SaaS) application, which is very easy to switch on and off, and it is helpful when you don't have an IT team to implement major projects. At the moment, more than 50,000 buildings around the world are connected to the platform. And we've added functionalities such as the Sustainability Manager gradually. We have also created new interfaces, for example, an interface with Electrification X. This is

Dr. Peter Koerte, Member of the Managing Board, Chief Technology Officer and Chief Strategy Officer, Siemens AG: With the power of technology we can create a better future, together. At Siemens, we believe digital technologies will be crucial in helping India achieve its ambitious sustainability goals while further solidifying its position as a global innovation and manufacturing hub.

Sunil Mathur, Managing Director and Chief Executive Officer, Siemens Limited: Digitalization will unlock new potential for India's industries. Investing in technology would give them the edge amidst intense global competition, regulatory requirements to meet sustainability outcomes and ambitious growth targets.
