rial, and health, along with tech and life sciences, are expected to thrive. “This growth is driven by industrial expansion, supportive government initiatives, increased capital accessibility, urbanisation, shifting consumer behaviour, and a young demographic,” he says.

The market is experiencing a rotation from the growth to quality stocks, which had underperformed in the past few years.

While capital goods, pharma, and two-wheelers are showing reduced outperformance, the information technology and metals sectors are gaining momentum. “The market is also witnessing a convergence between mid/small-cap and large-cap performance differentials. This rotation pattern suggests that traditional manufacturing sectors, particularly quality-focussed large-caps in IT, could lead the comeback. However, investors should maintain cautious positioning in metals and commodities due to uncertain growth catalysts and dependence on the Chinese market dynamics,” says Parakh.

Domestic private capital expenditure is expected to lead the next phase of growth for the traditional sectors, says Shinghal. He also points to two other factors: global supply chains stabilising and companies reassessing and strengthening their supply networks after pandemic disruptions; and the government’s policy push with PLI schemes. “[These are] expected to lead to an acceleration in growth for manufacturing,” he says.

In the following pages, read about what some of the companies on the list have done right and their future plans. **BT**
